# New large-scale CIB maps from Planck data

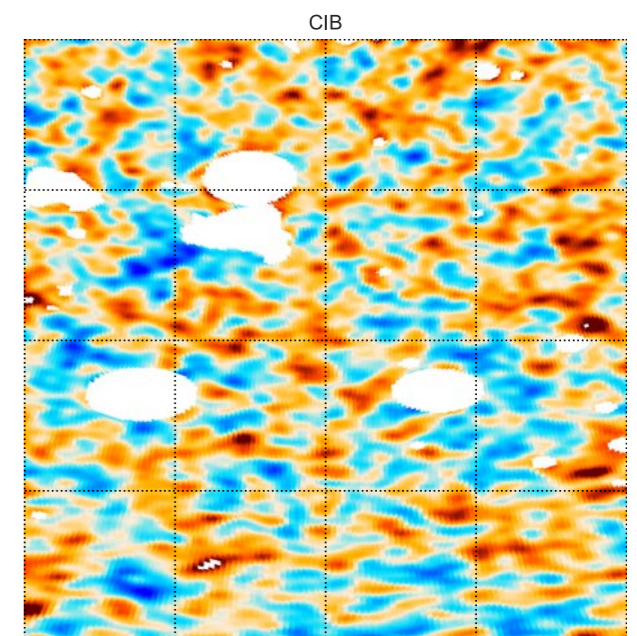

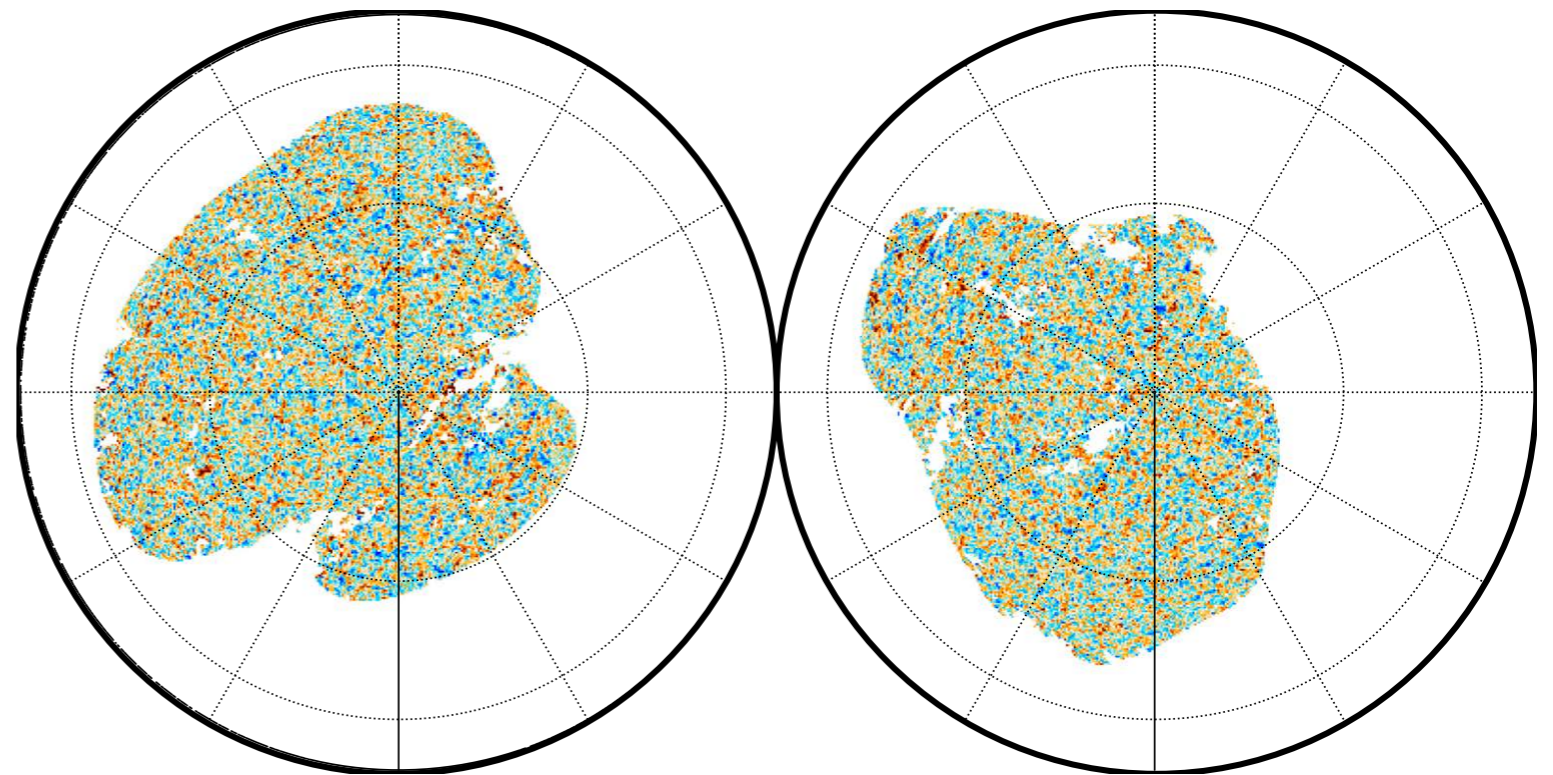

in collaboration with O. Doré,  
G. Lagache, B. Hensley

**Jet Propulsion Laboratory**  
California Institute of Technology

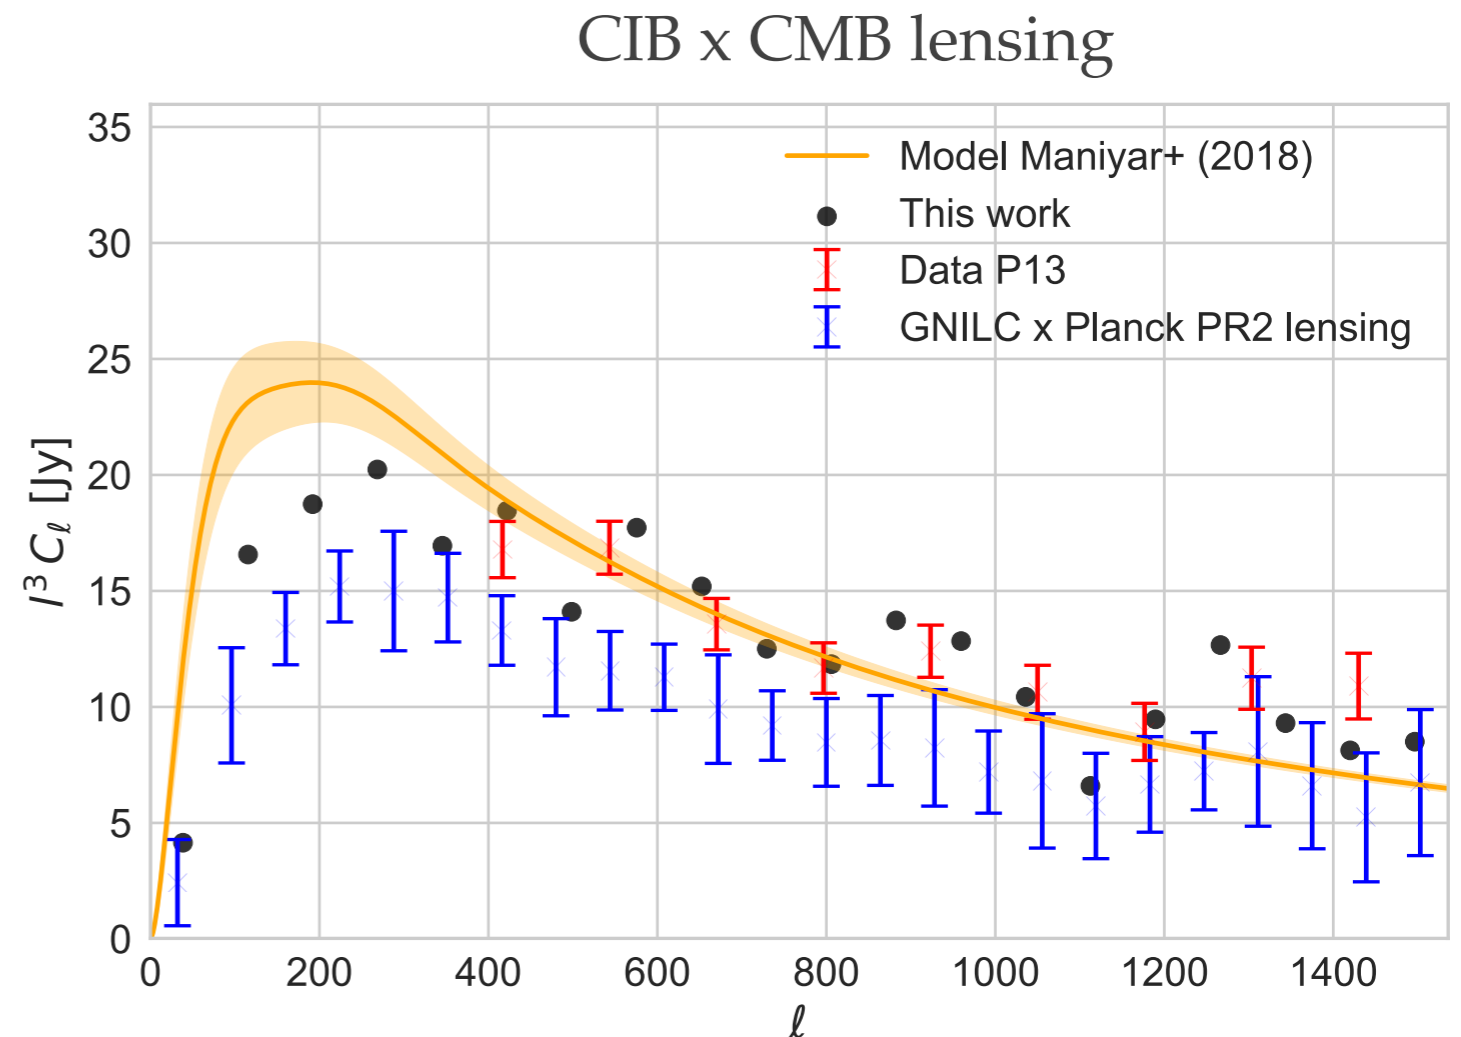

# Conclusions

- ❖ New CIB maps for  $\sim 30\%$  of the sky, 217-857 GHz
- ❖ Fewer systematics, larger sky fraction than previous work
- ❖ Powerful for cross-correlations and de-lensing

# Conclusions

- ❖ New CIB maps for  $\sim 30\%$  of the sky, 217-857 GHz
- ❖ Fewer systematics, larger sky fraction than previous work
- ❖ Powerful for cross-correlations and de-lensing

# What is the CIB?

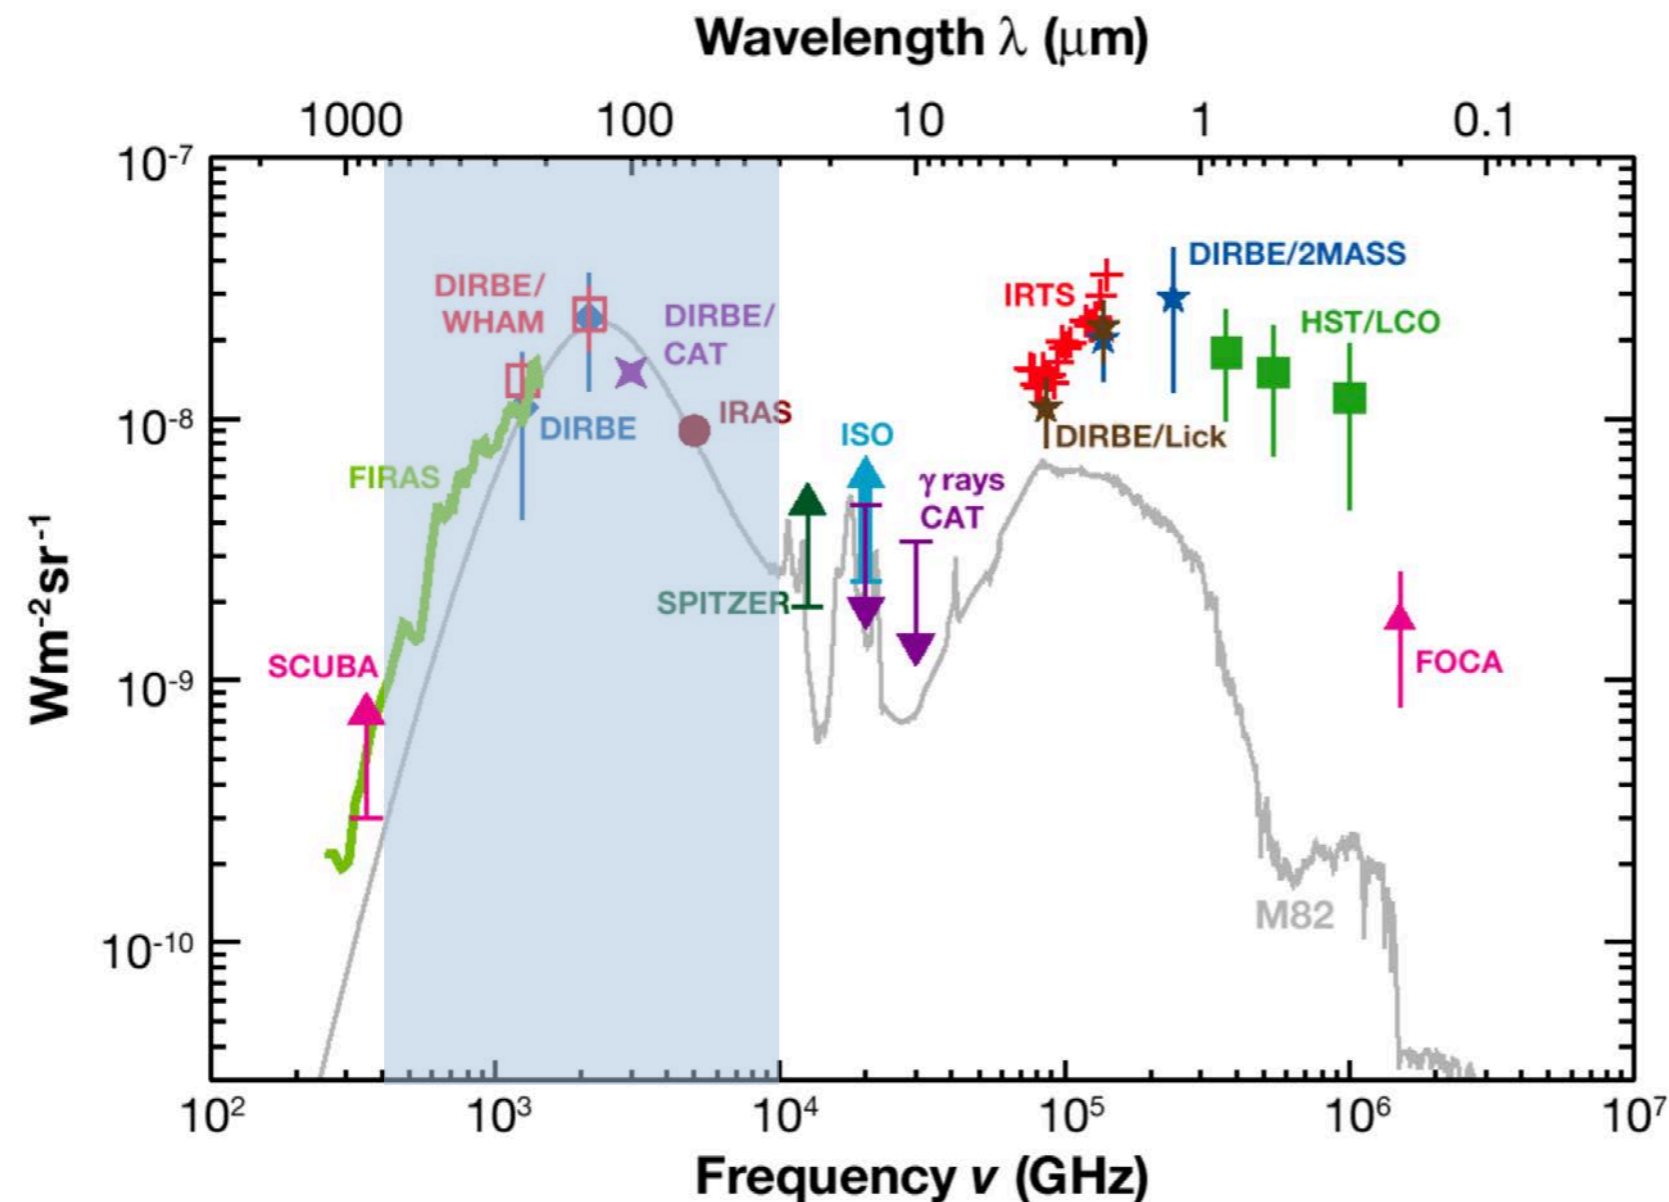

Extragalactic background light

- ❖ Made up from dust in galaxies at  $z=1-3$
- ❖ First detected in FIRAS data (Puget+ 1996)

# What is the CIB?

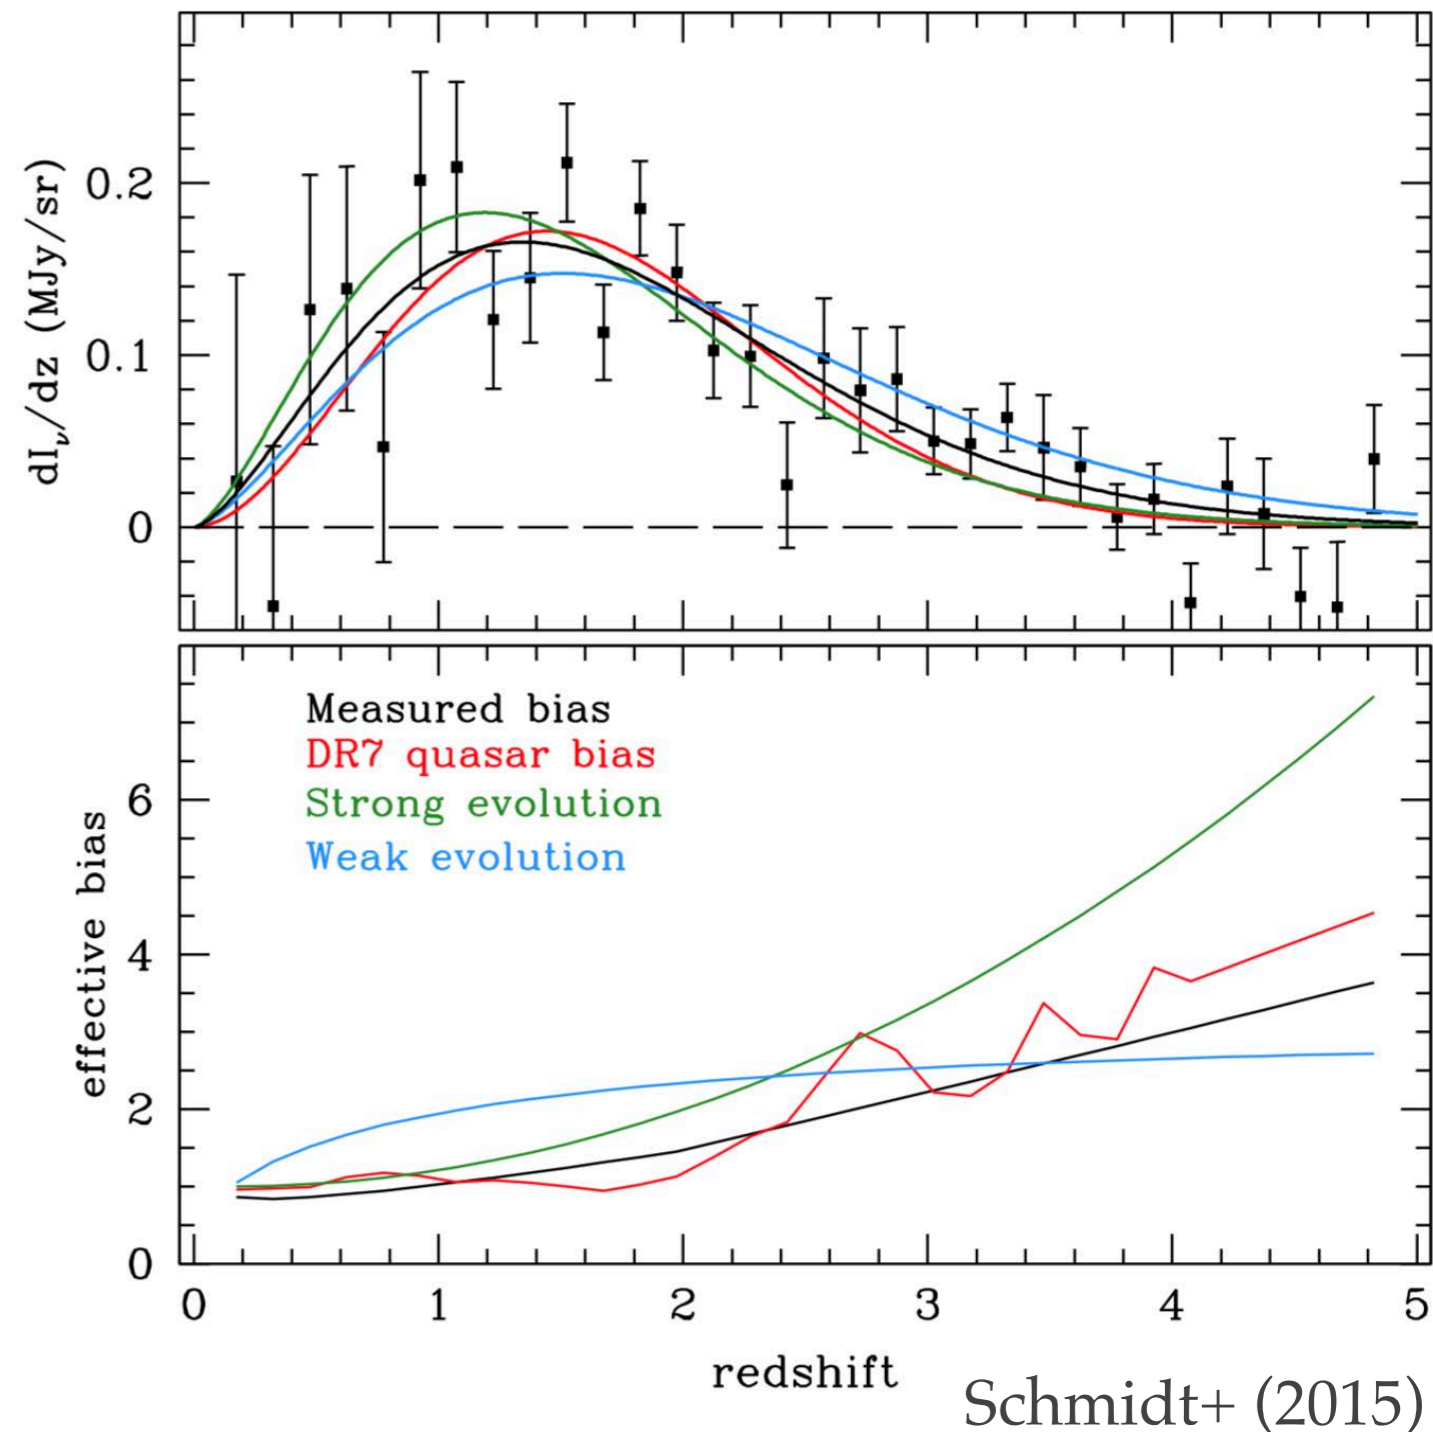

Extragalactic background light

- ❖ Made up from dust in galaxies at  $z=1-3$
- ❖ First detected in FIRAS data (Puget+ 1996)

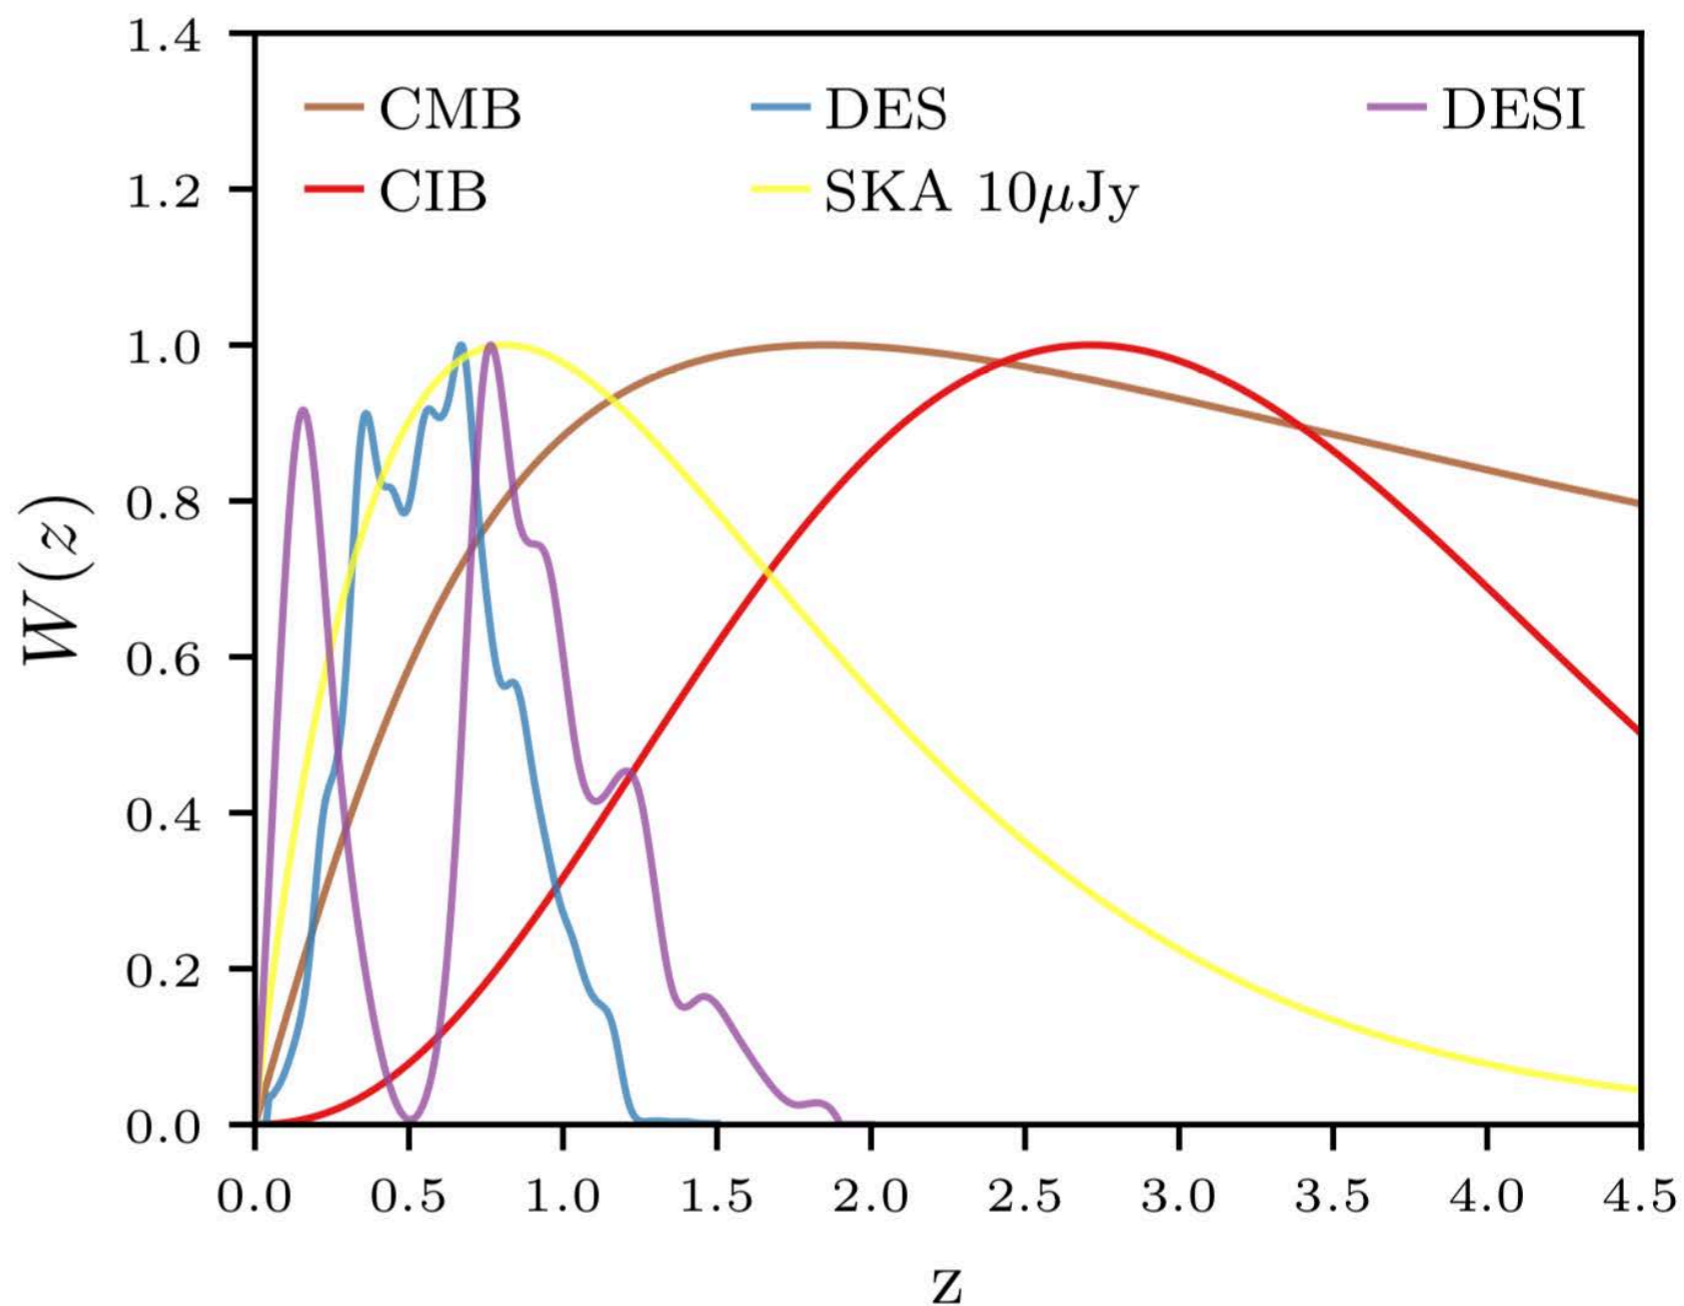

# Why study the CIB? Star-formation!

- ❖ Strong constraints on star formation history
- ❖ Probe dust temperature across cosmic times
- ❖ Understand star formation in DM halos

# Why study the CIB? Grav. lensing!

- ❖ CIB kernel and the CMB lensing kernel are well matched
- ❖ Internal de-lensing and CIB is very complimentary for BB reconstruction

Manzotti (2017)

# Why study the CIB? Grav. lensing!

- ❖ Cross-correlation of CIB and CMB lensing strongly detected in Planck data
- ❖ Lots of room for improvement: Sky fraction, CIB data, new CMB lensing map

Planck collaboration (2013, XVII)

---

# How to obtain CIB maps?

---

- ❖ Galactic thermal dust and CIB dust dominate on large scales at  $\sim 200$  to  $1000$  GHz
- ❖ How to disentangle them?

---

# How to obtain CIB maps?

---

- ❖ Galactic thermal dust and CIB dust dominate on large scales at ~200 to 1000 GHz
- ❖ How to disentangle them?
  - A. Fit different frequency channels with modified blackbody spectra
  - B. Use the different angular power spectra of these components (GNILC)
  - C. Use template maps of Galactic dust (e.g. HI-based)

# Correlation of dust and gas

- ❖ Linear relation to first order (Boulanger+ 1996)
- ❖ But better model required to get to CIB levels

# HI4PI Survey

HI4PI collaboration  
(2017)

- ❖ Merges data from Effelsberg and Parkes
- ❖ Replaces LAB as state-of-the-art full-sky HI survey
- ❖ Higher sensitivity & resolution, fewer systematics, full sampling

---

# Two challenges

---

- ❖ Spectrally
  - ❖  $O(1000)$  velocity channels in HI
  - ❖ Need to control overfitting

---

# Two challenges

---

- ❖ Spectrally

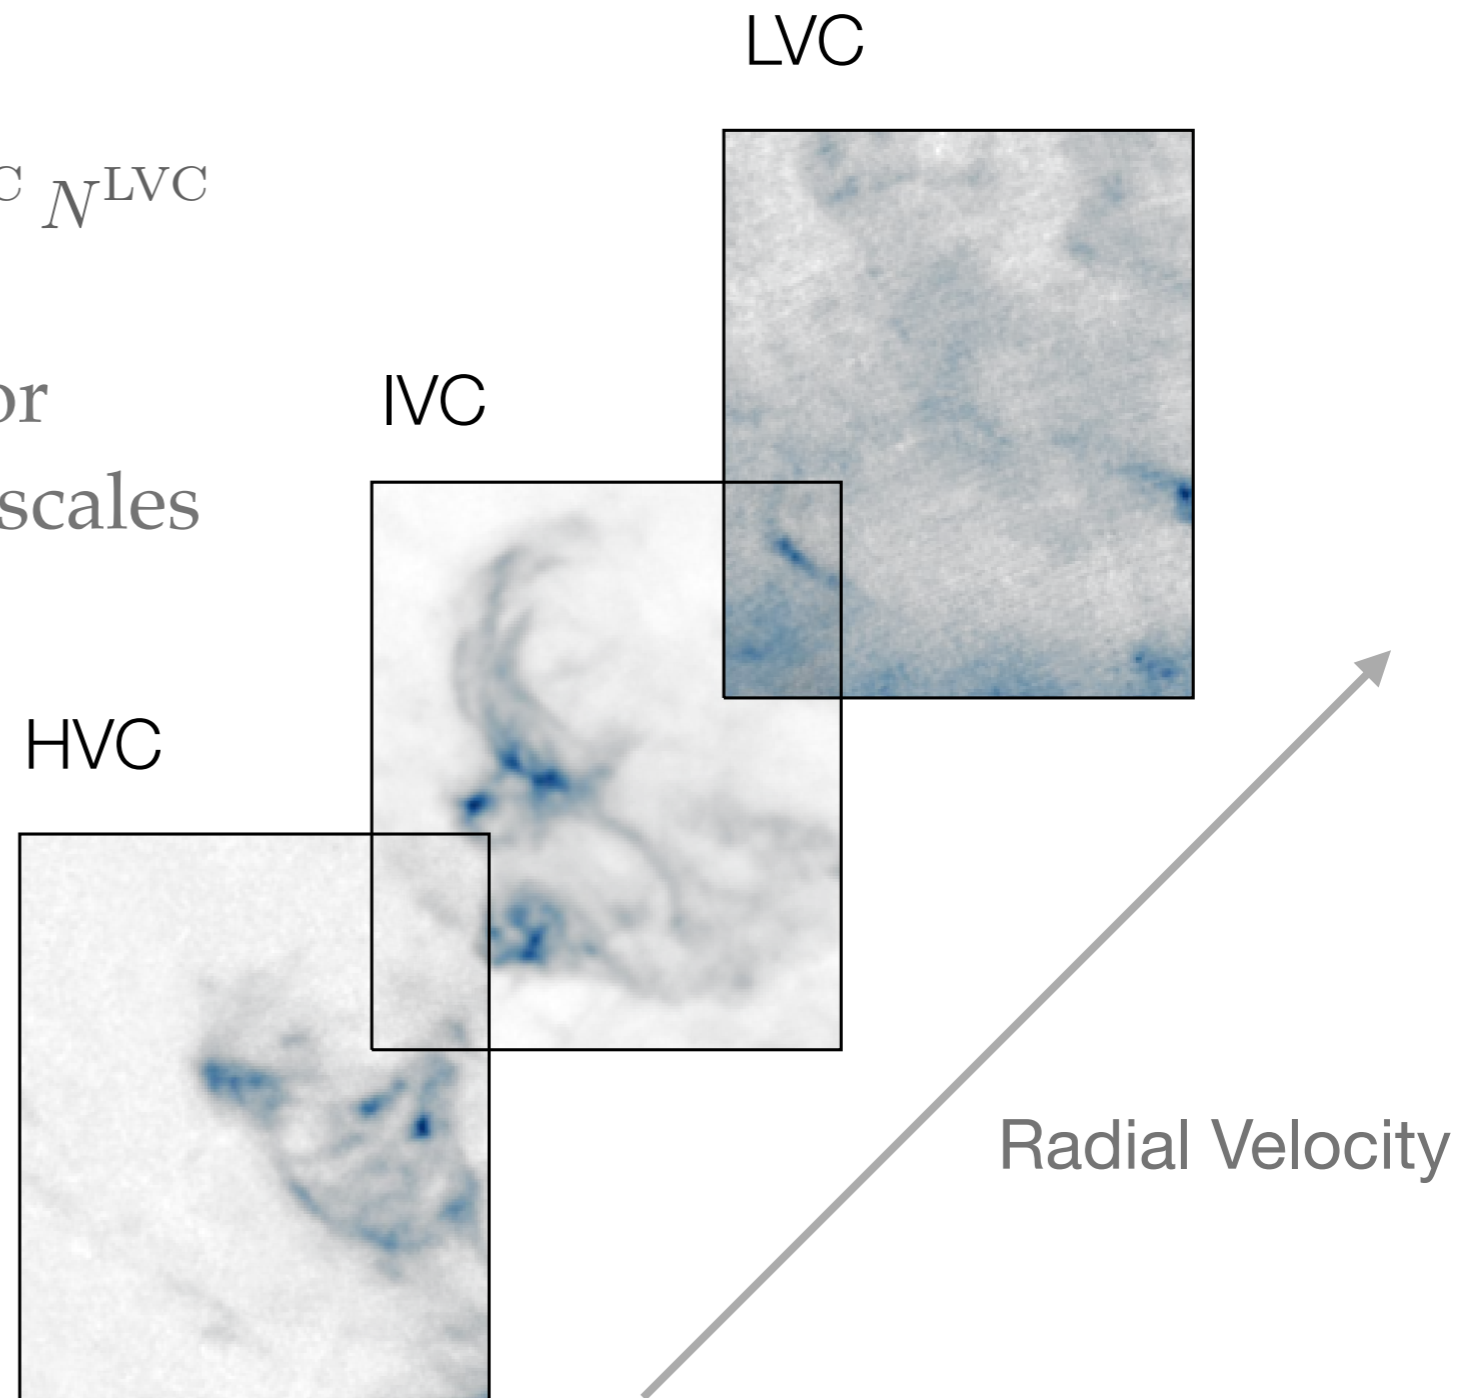

- ❖  $O(1000)$  velocity channels in HI
- ❖ Need to control overfitting

- ❖ Spatially

- ❖ Dust-to-gas ratios vary over the sky
- ❖ Need to preserve large-scale CIB power

# HI-based dust models

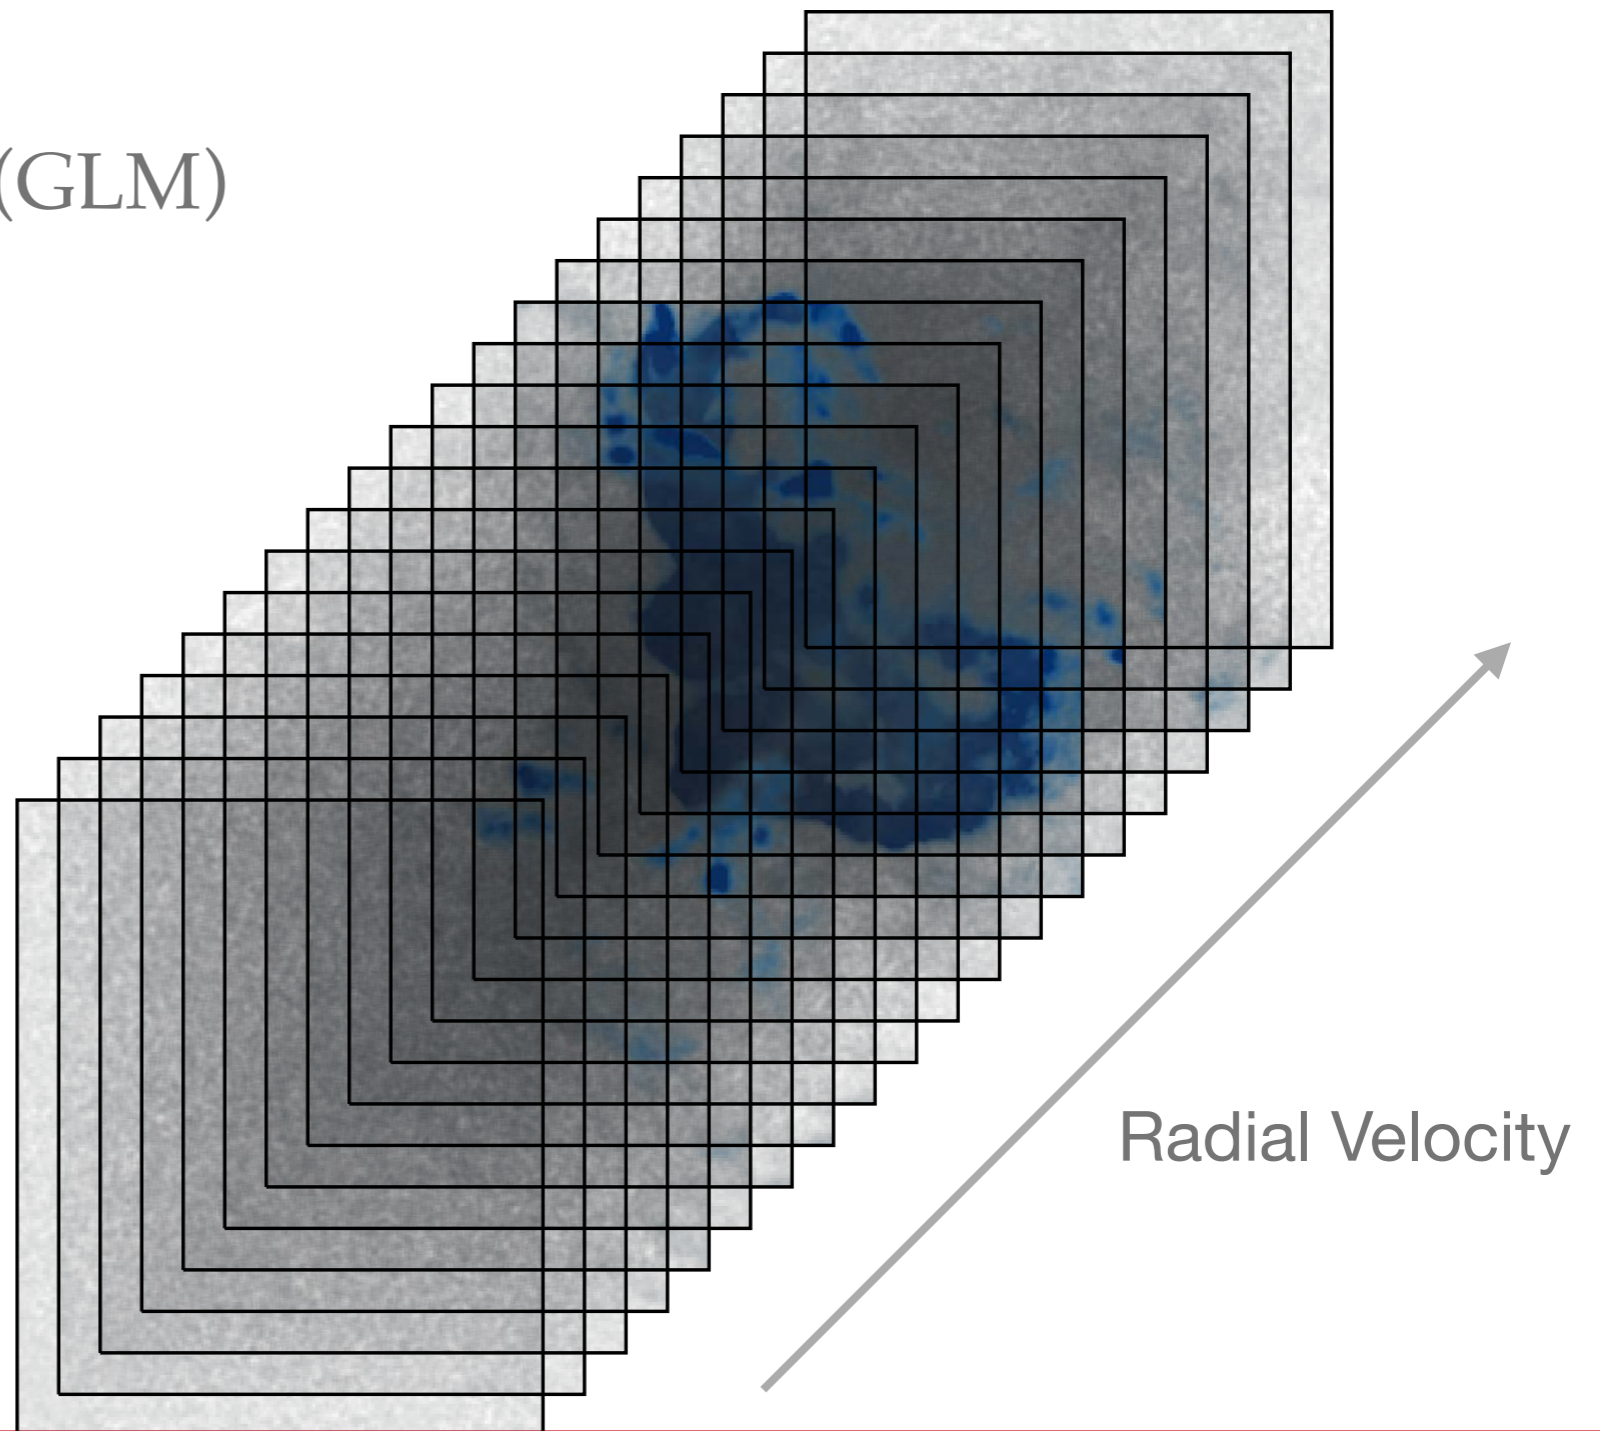

- $I = \epsilon^{\text{HVC}} N^{\text{HVC}} + \epsilon^{\text{IVC}} N^{\text{IVC}} + \epsilon^{\text{LVC}} N^{\text{LVC}}$
- Velocity separation difficult for complex structures and large scales

# HI-based dust models

- Generalised linear model (GLM)

- $$I = \sum_i \epsilon^i T_B^i$$

# HI-based dust models

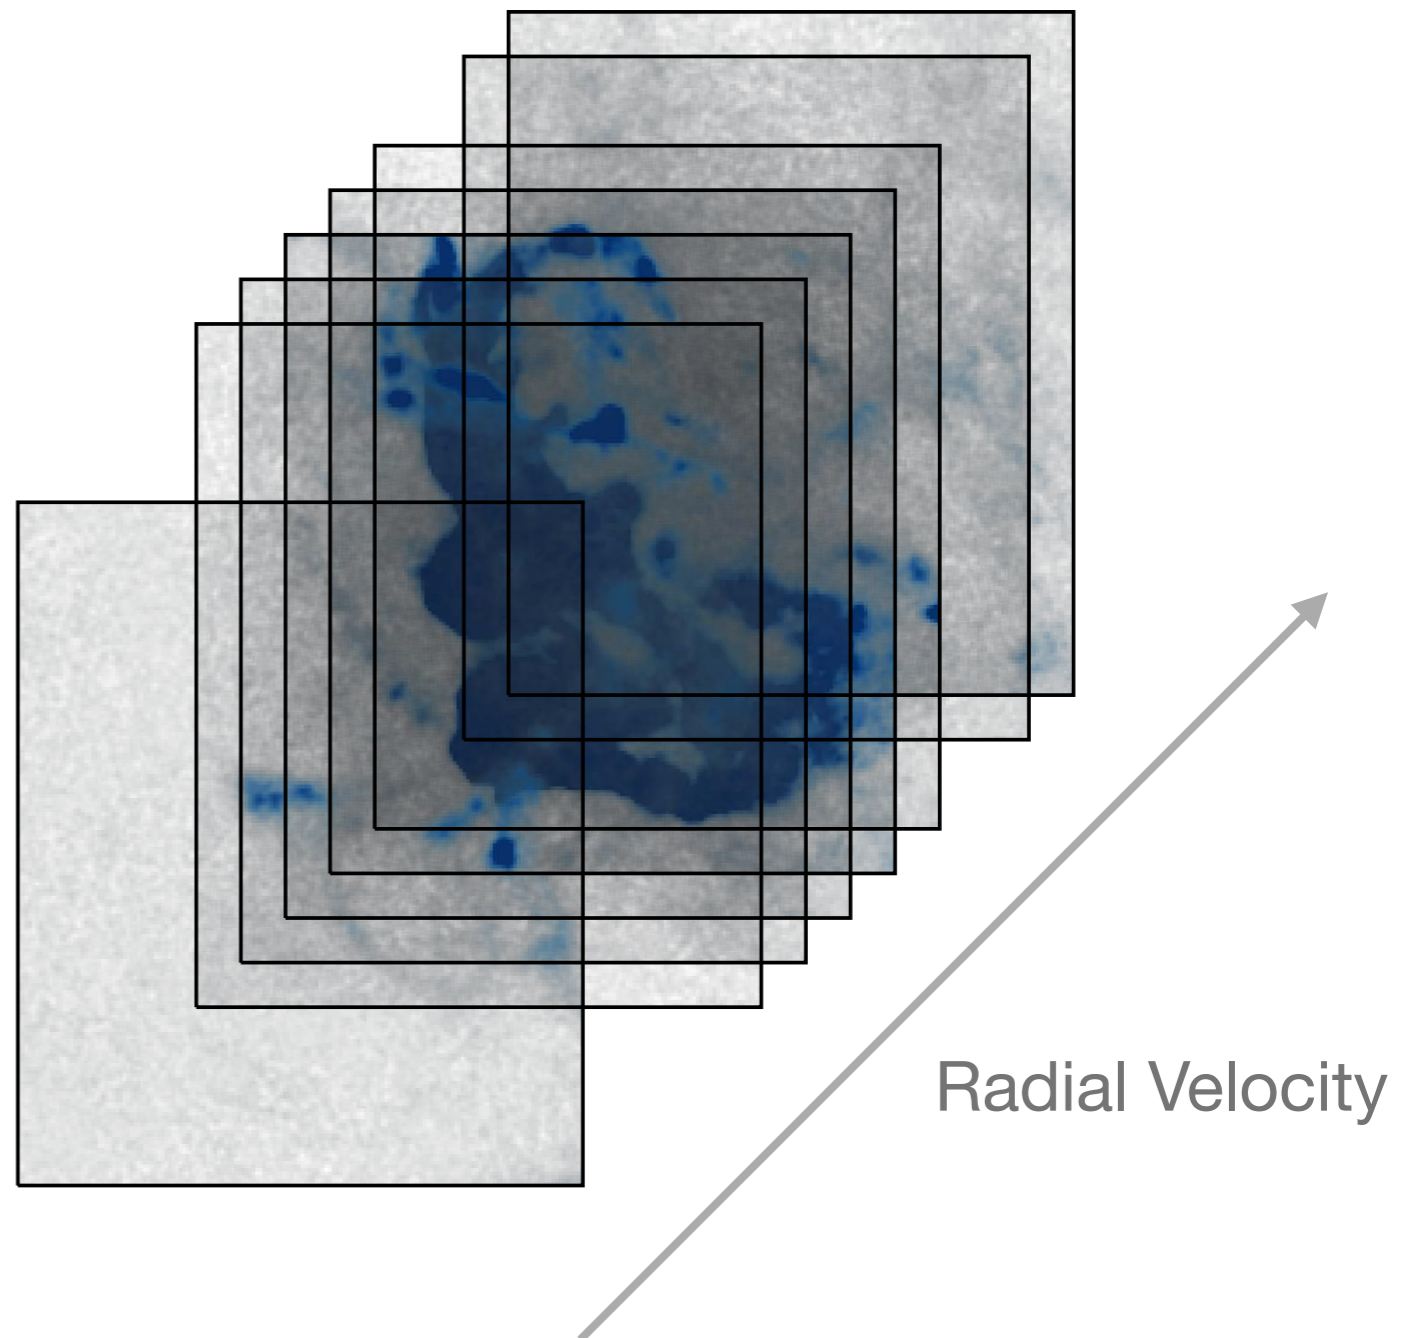

- Generalised linear model (GLM)

- $I = \sum_i \epsilon^i T_B^i$

- Regularised:

- $|\text{Data}_i - \text{Model}_i|^2 + \alpha \cdot |\epsilon_i|$

- Accounts for all features along line of sight

# Preliminary Results

(give us two weeks)

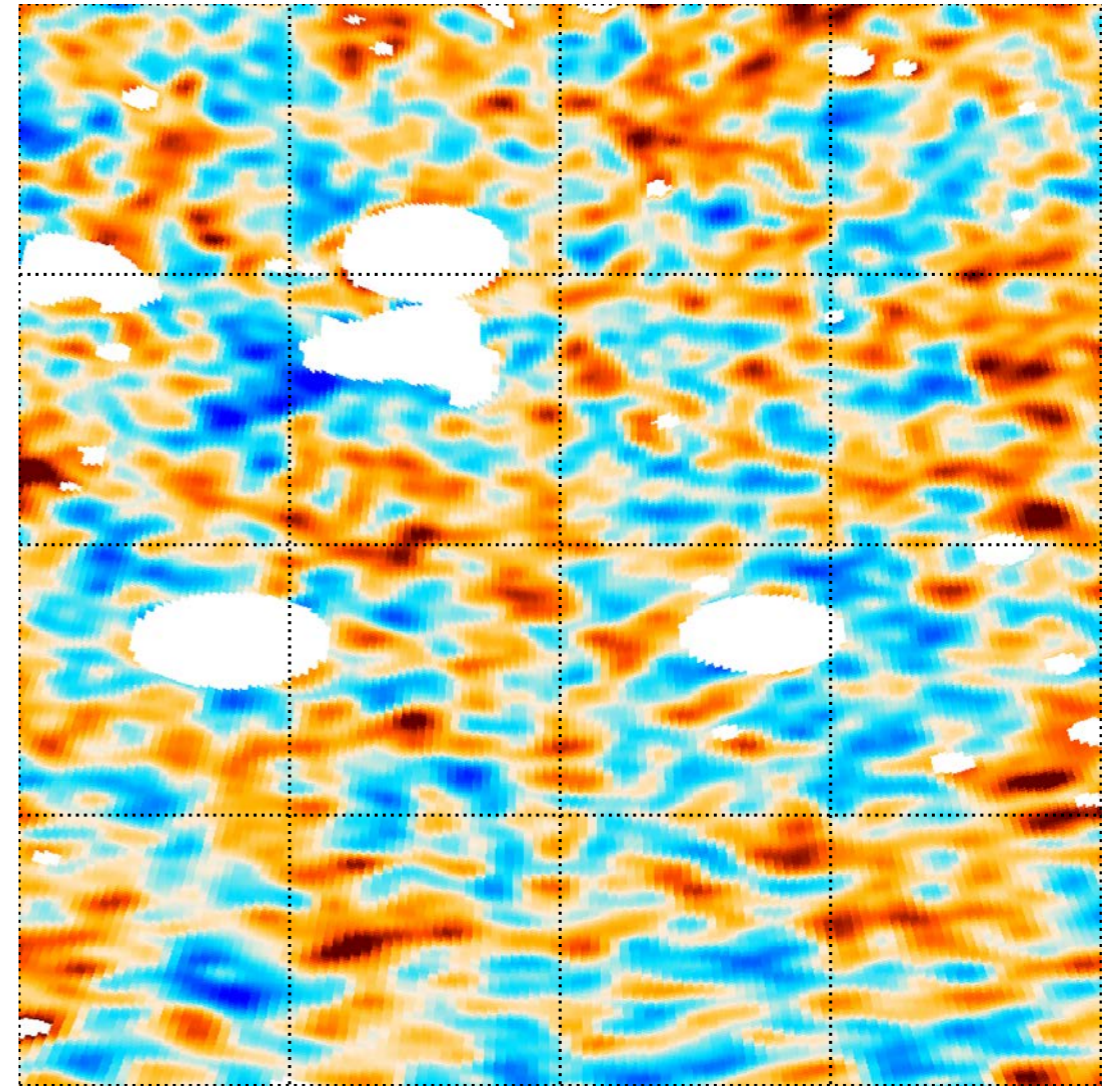

# Maps: Smaller regions

Total intensity

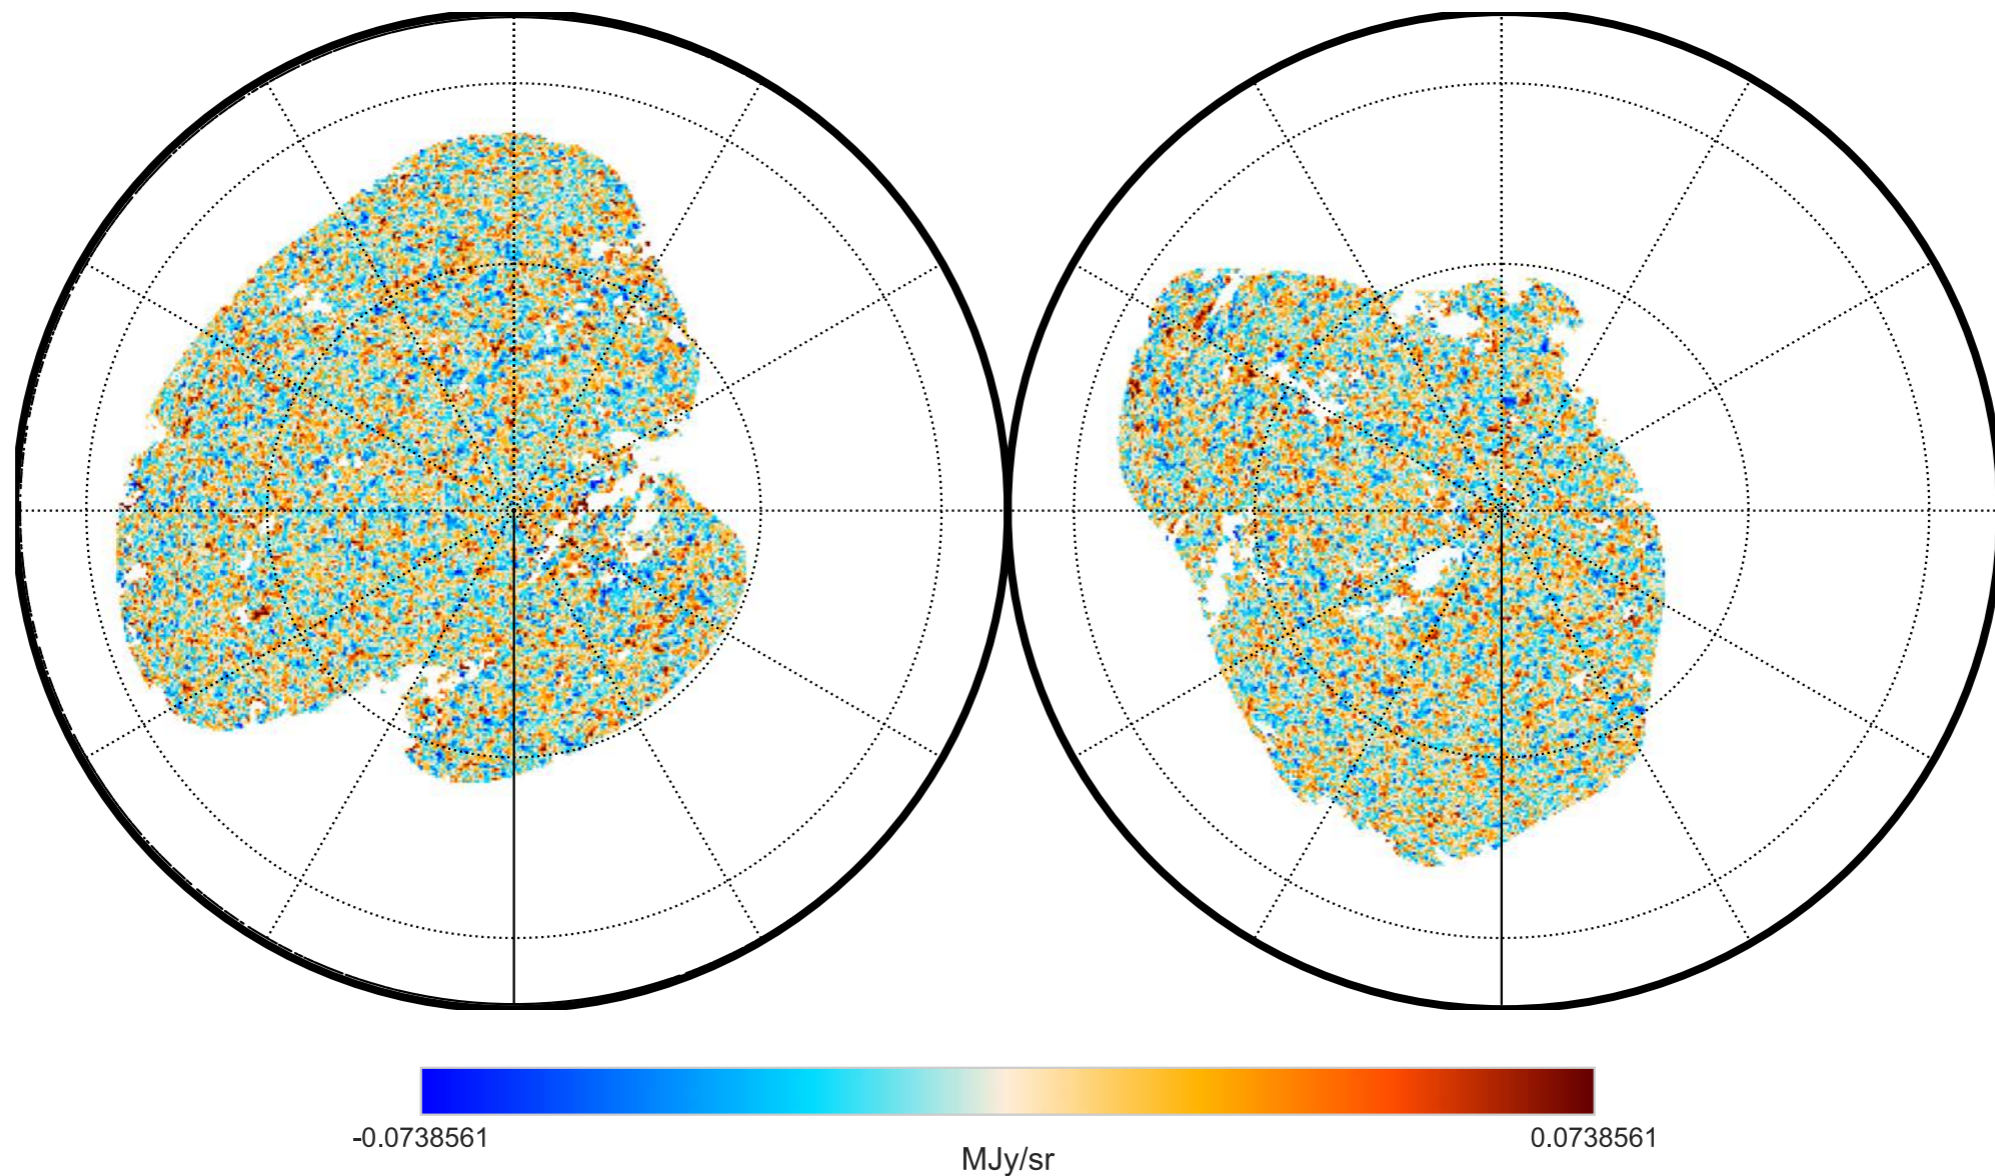

-0.0314 0.157 MJy/sr

CIB

-0.0314 0.0314 MJy/sr

# Maps: Large-scale map

~30% of the sky, 5 frequencies, 10 arcmin

# Gaussianity

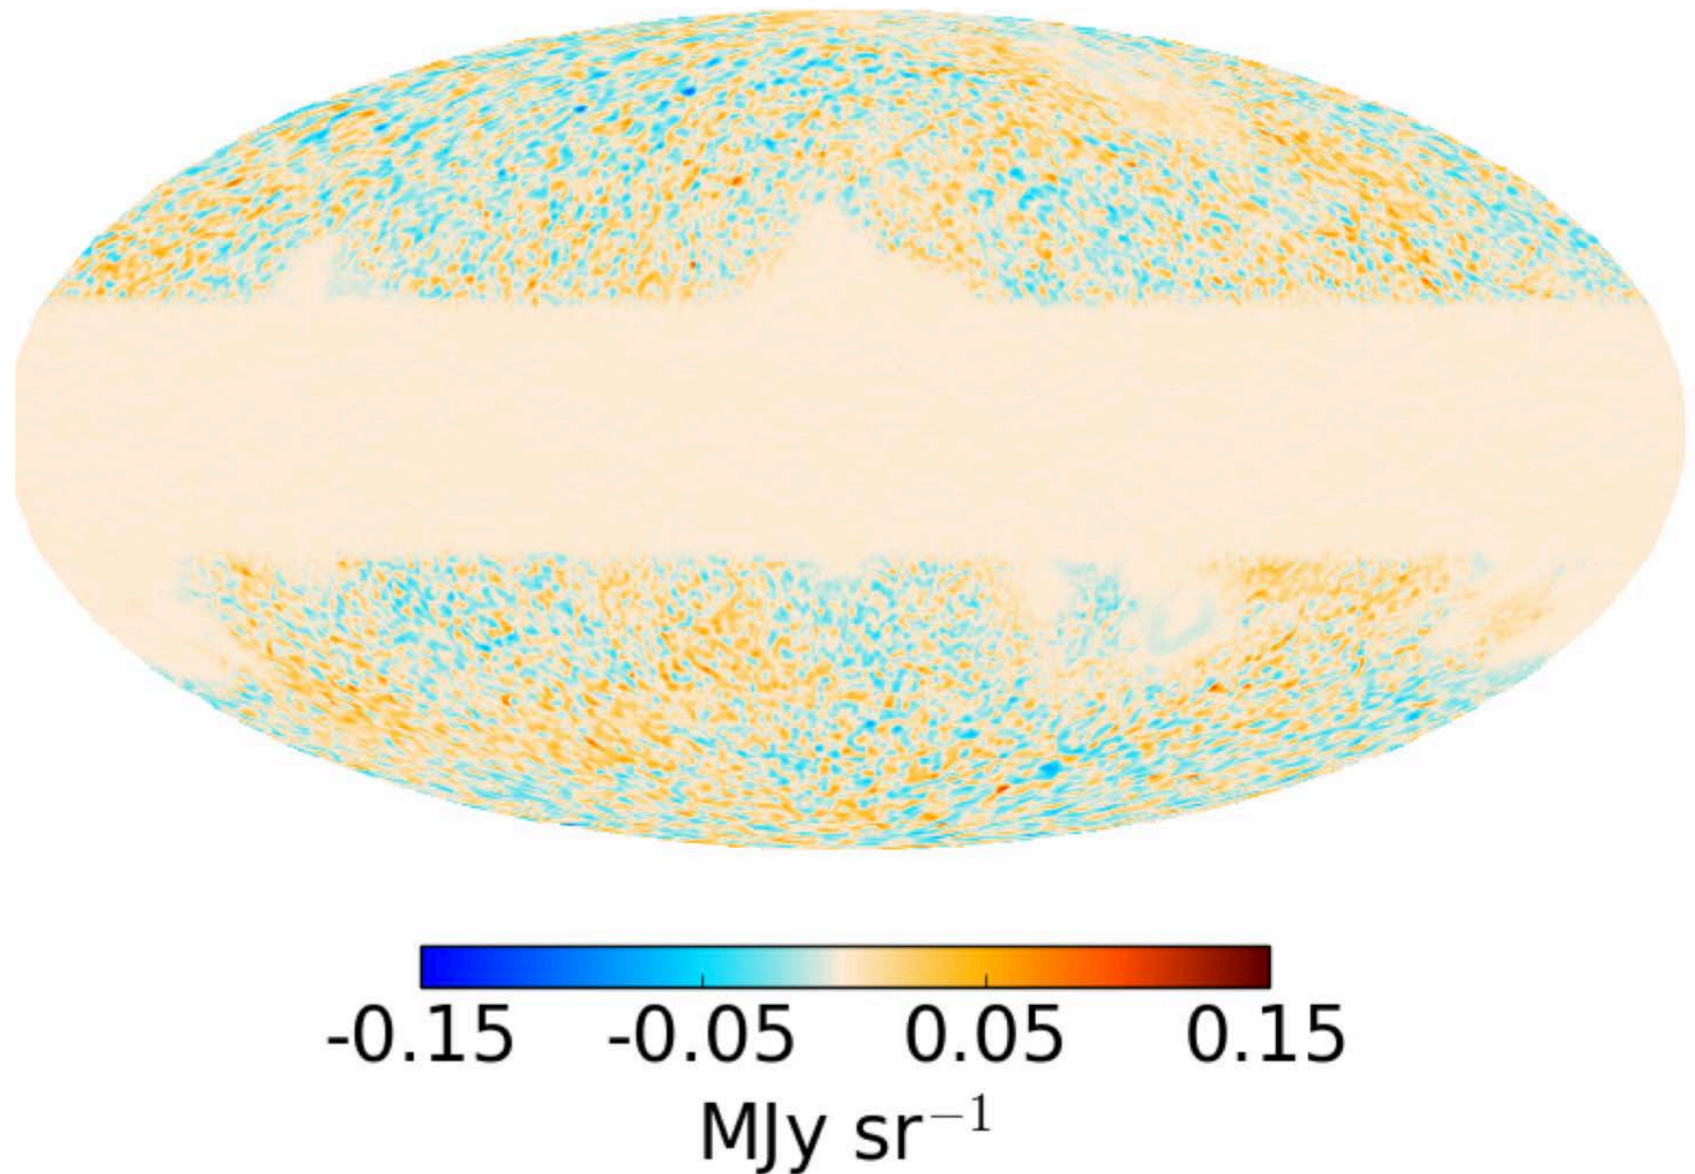

- ❖ Patch-by-patch analysis
- ❖ Full sky PDF very Gaussian
- ❖ Molecular gas adds skewness

# Comparison to earlier work

## Maps

# Based on spatial information: GNILC

- ❖ Power-spectrum based
- ❖ Designed to remove CIB from Galactic dust maps
- ❖ Over-subtraction of CIB

Planck (2016 XLVIII)

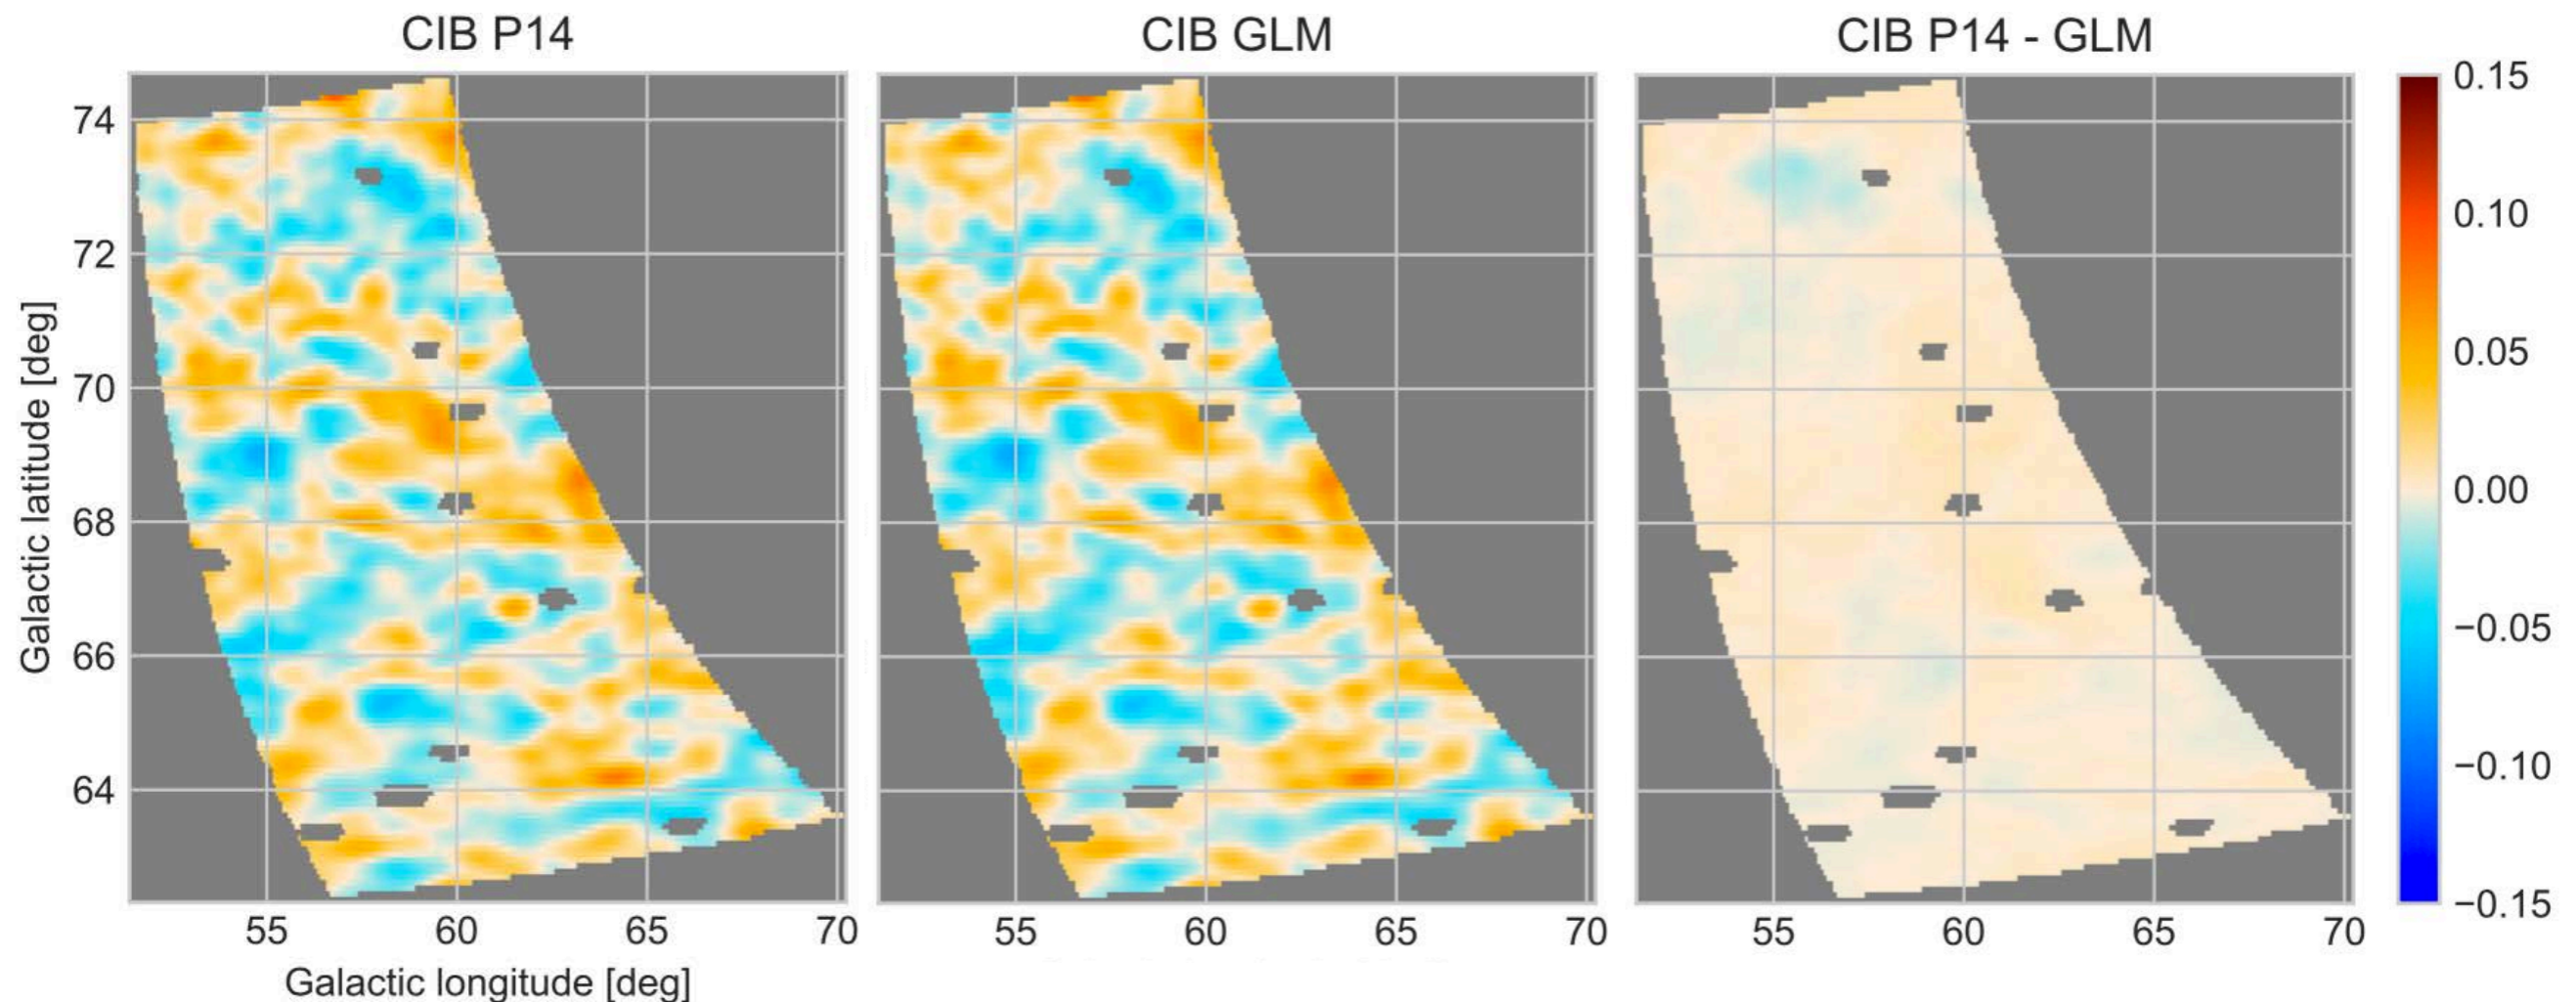

# HI-based: Planck (2014 XXX)

- ❖ ~10 individual fields, HI data from the GBT
- ❖ Two larger fields from EBHIS and GASS
- ❖ One field cleaned at a time
- ❖ Manual fine-tuning

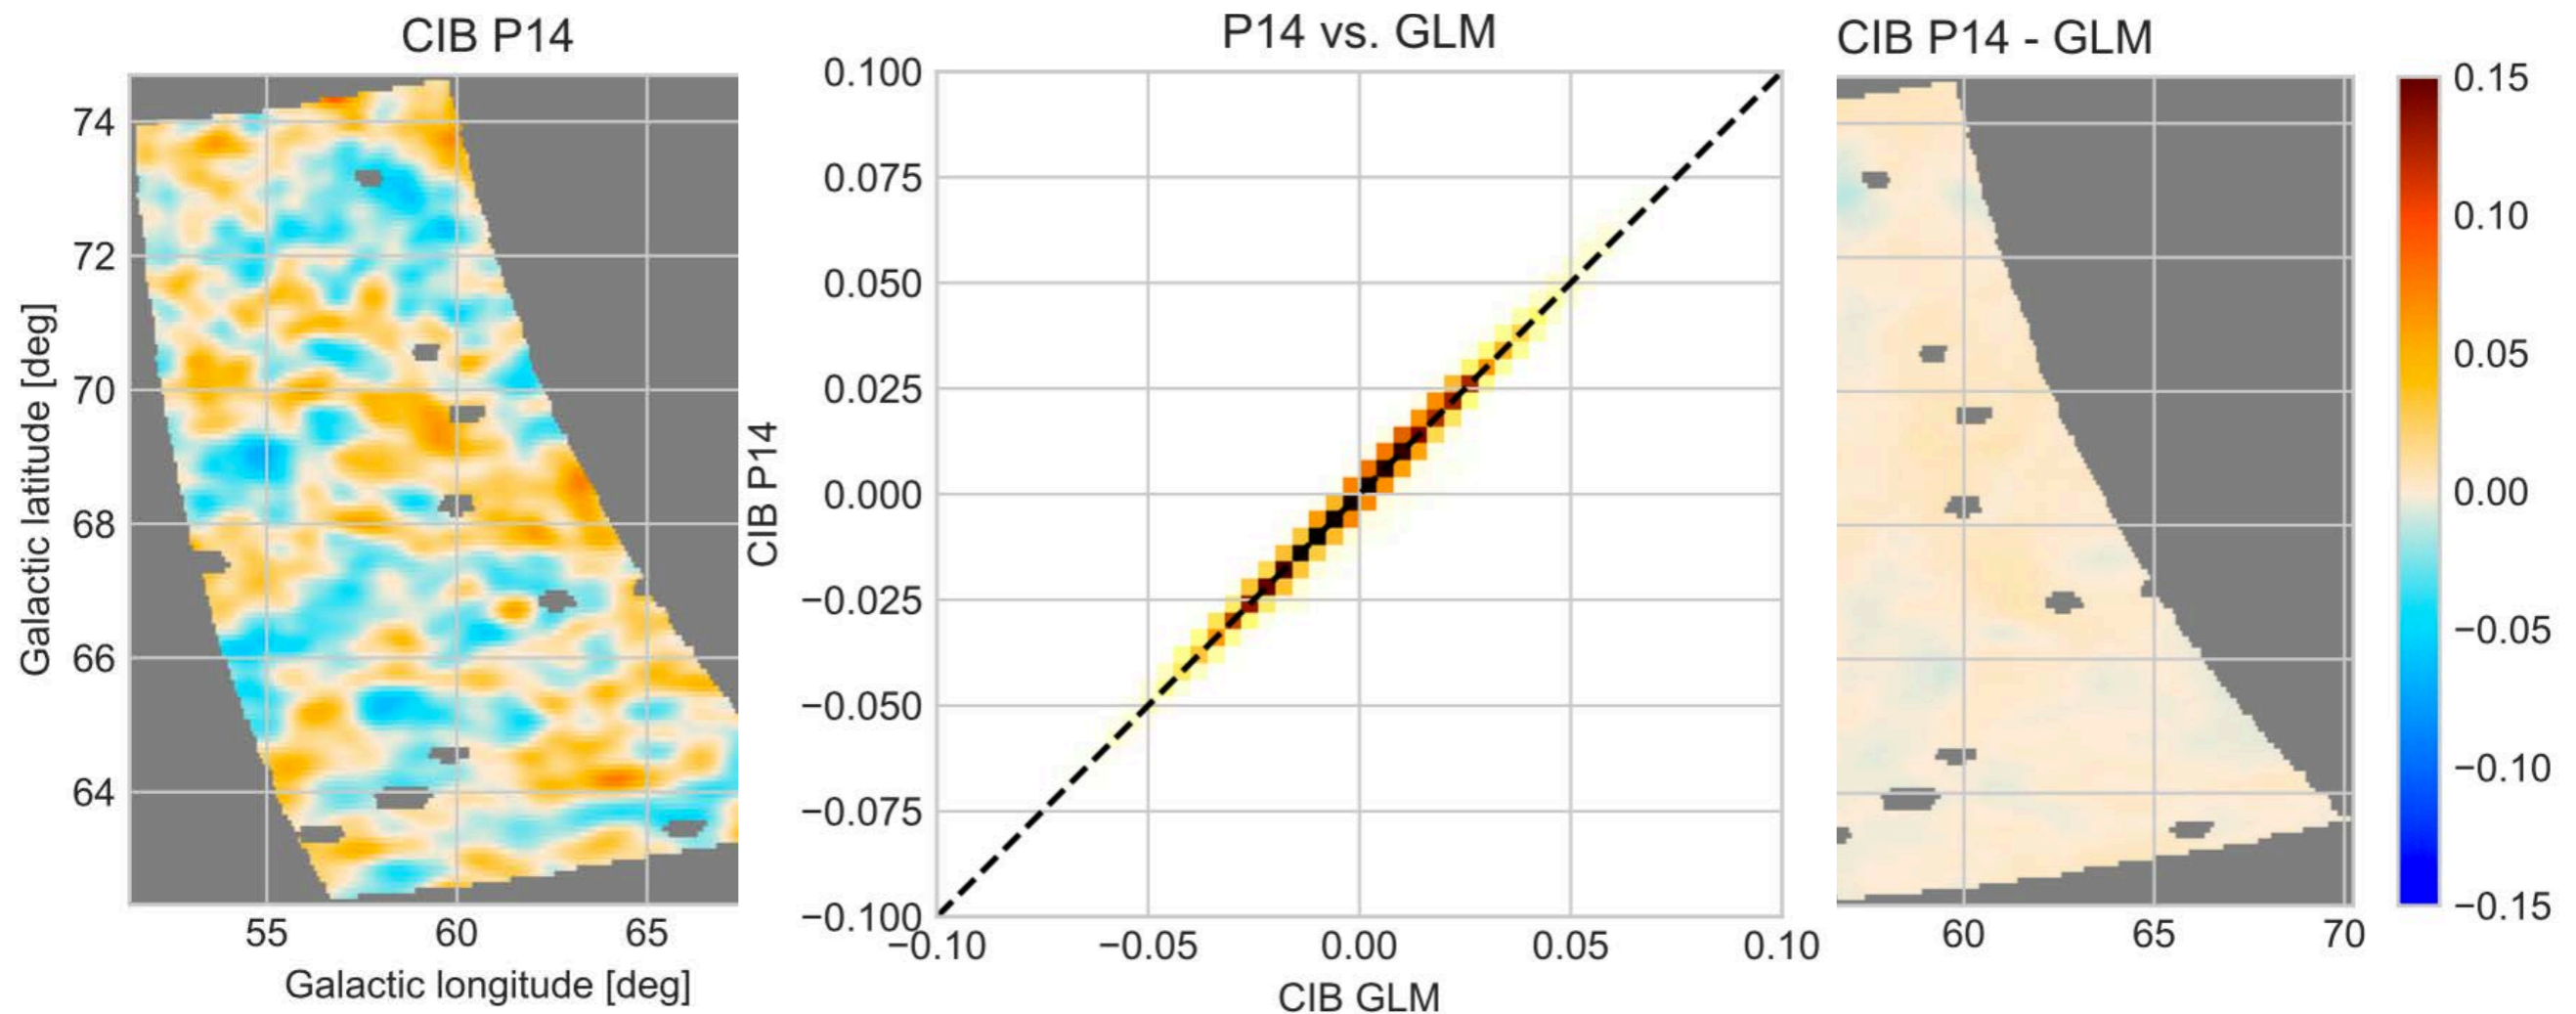

# Comparison to earlier work: Small fields

- ❖ Different data sets, resolutions, sky regions
- ❖ Apples-to-apples comparison yields great agreement

# Comparison to earlier work: Small fields

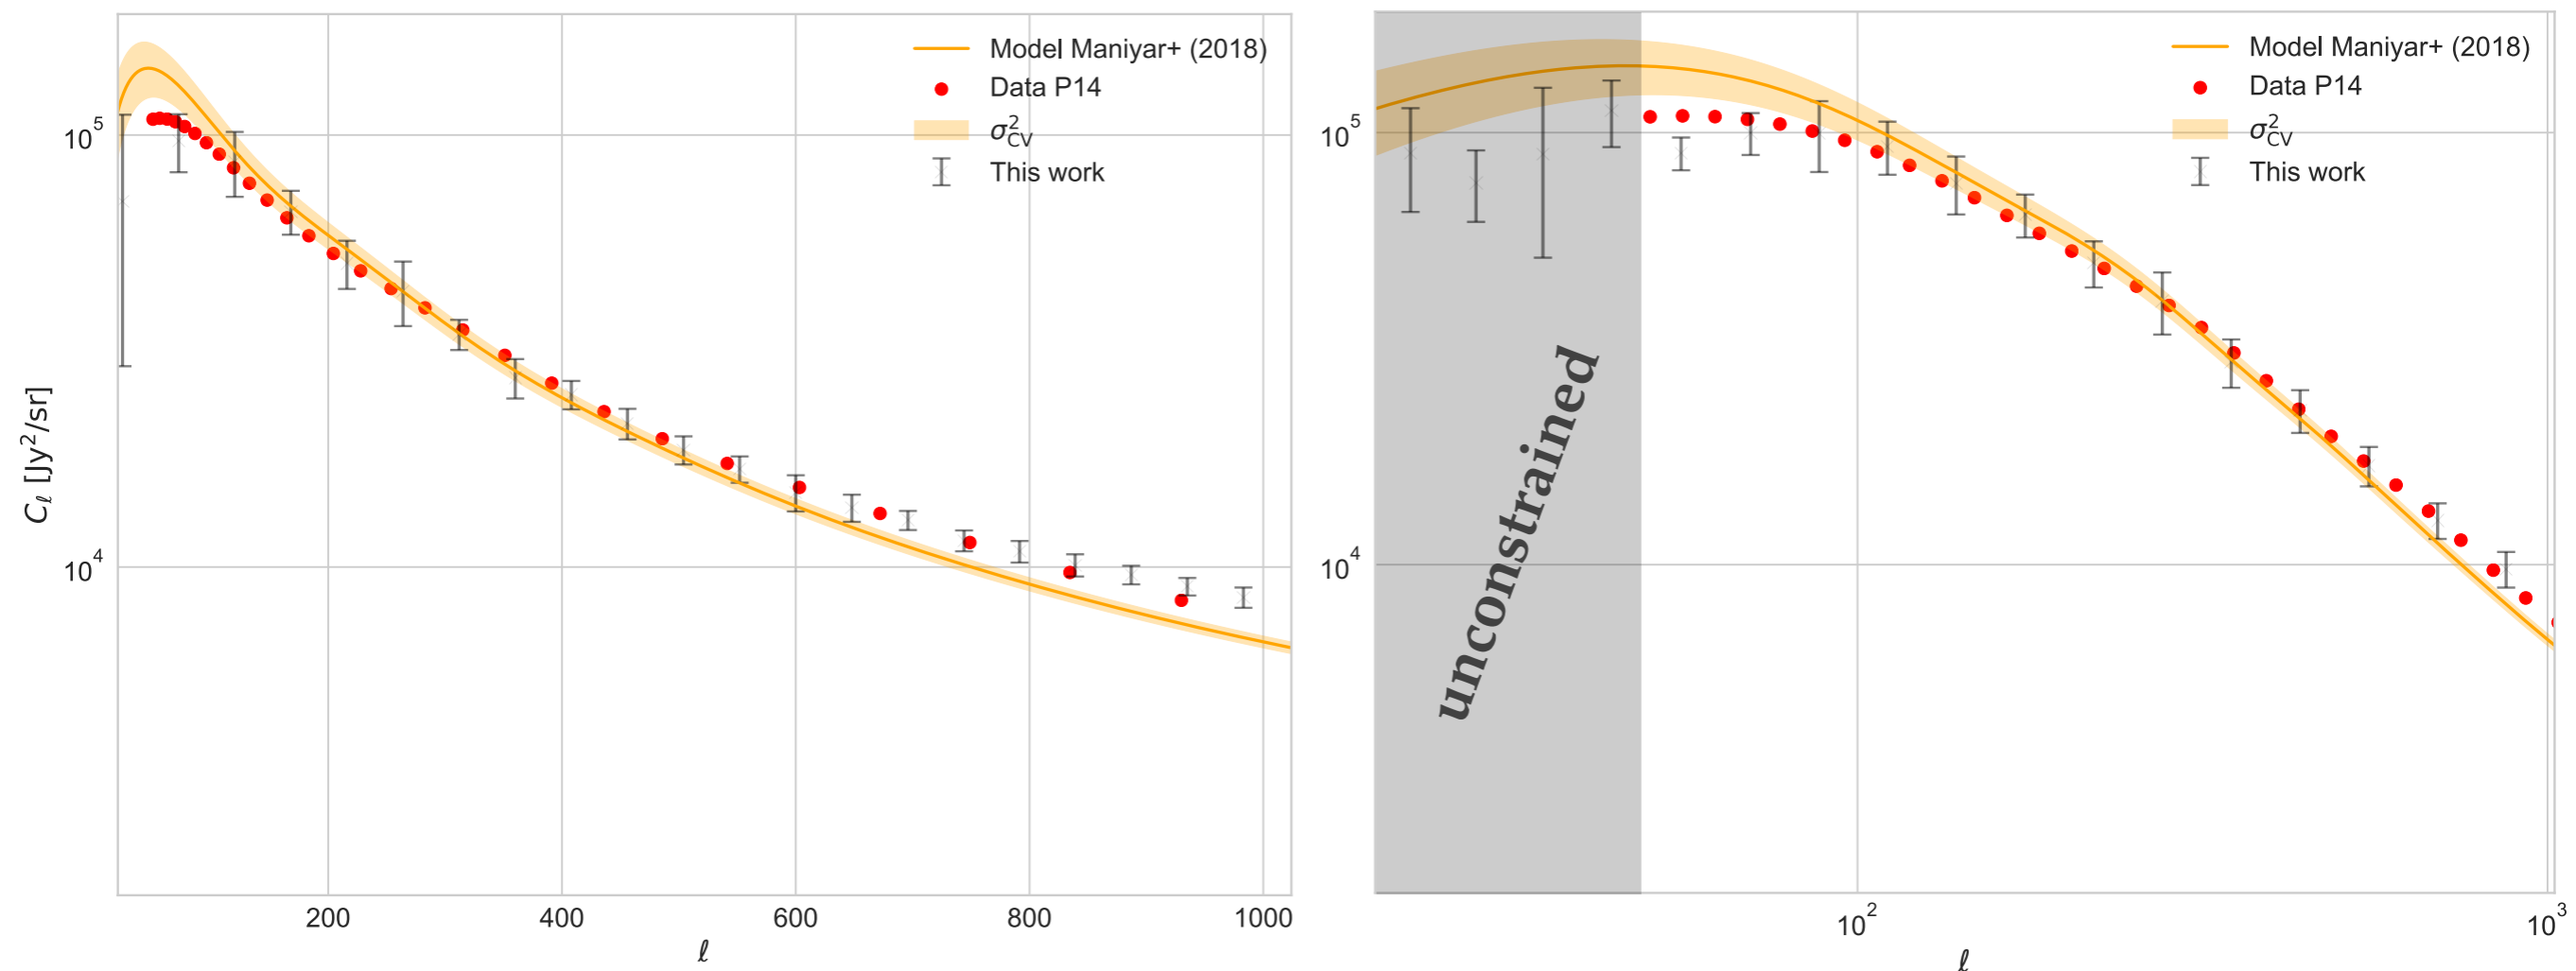

- ❖ Different data sets, resolutions, sky regions
- ❖ Apples-to-apples comparison yields great agreement

# Comparison to earlier work

## Power spectra

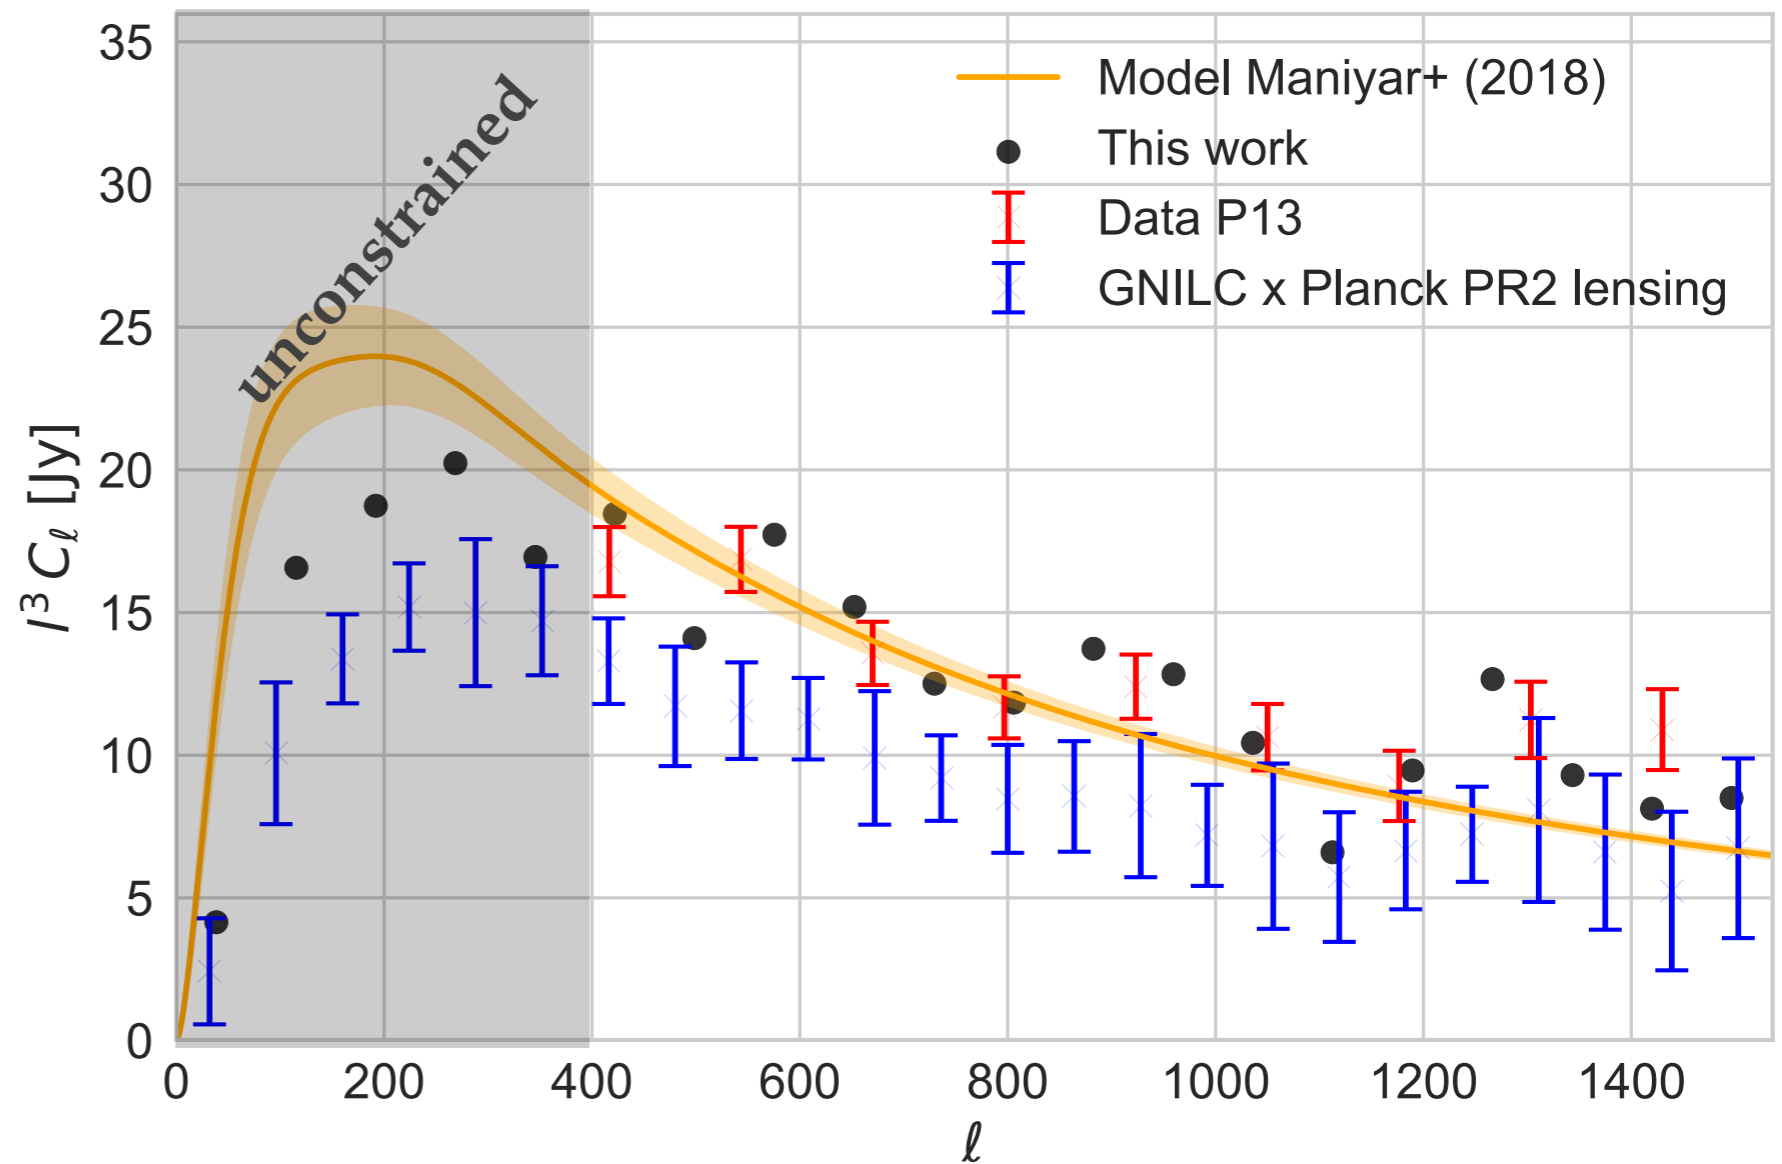

# CIB auto power spectra

- ❖ Great agreement with Planck (2014 XXX)
- ❖ Extends to larger scales
- ❖ Maps will be public

# CIB - CMB lensing cross power

- ❖ Great agreement with Planck (2013 XVIII)
- ❖ Extends to larger scales
- ❖ GNILC x Phi shows weaker correlation

# CIB - CMB lensing cross correlation coefficient

- ❖  $> 60\%$  correlation for  $l \geq 100$
- ❖  $\sim 10\text{-}15\%$  higher than with GNILC CIB
- ❖ Powerful in combination with Planck lensing map for BB de-lensing

---

# Conclusions

---

- ❖ Large-scale Planck CIB maps for 5 frequencies
- ❖ Significant improvement in component separation
- ❖ Better understanding of systematics
- ❖ Large scales are challenging!

---

# Conclusions

---

- ❖ Large-scale Planck CIB maps for 5 frequencies
- ❖ Significant improvement in component separation
- ❖ Better understanding of systematics
- ❖ Large scales are challenging!
  
- ❖ CIB is powerful probe of large-scale structure
- ❖ Study cosmic star-formation
- ❖ De-lensing for current and future CMB experiments

Thank you!

Input CIB

Mean per field

After mean subtraction

# Large-scale bias

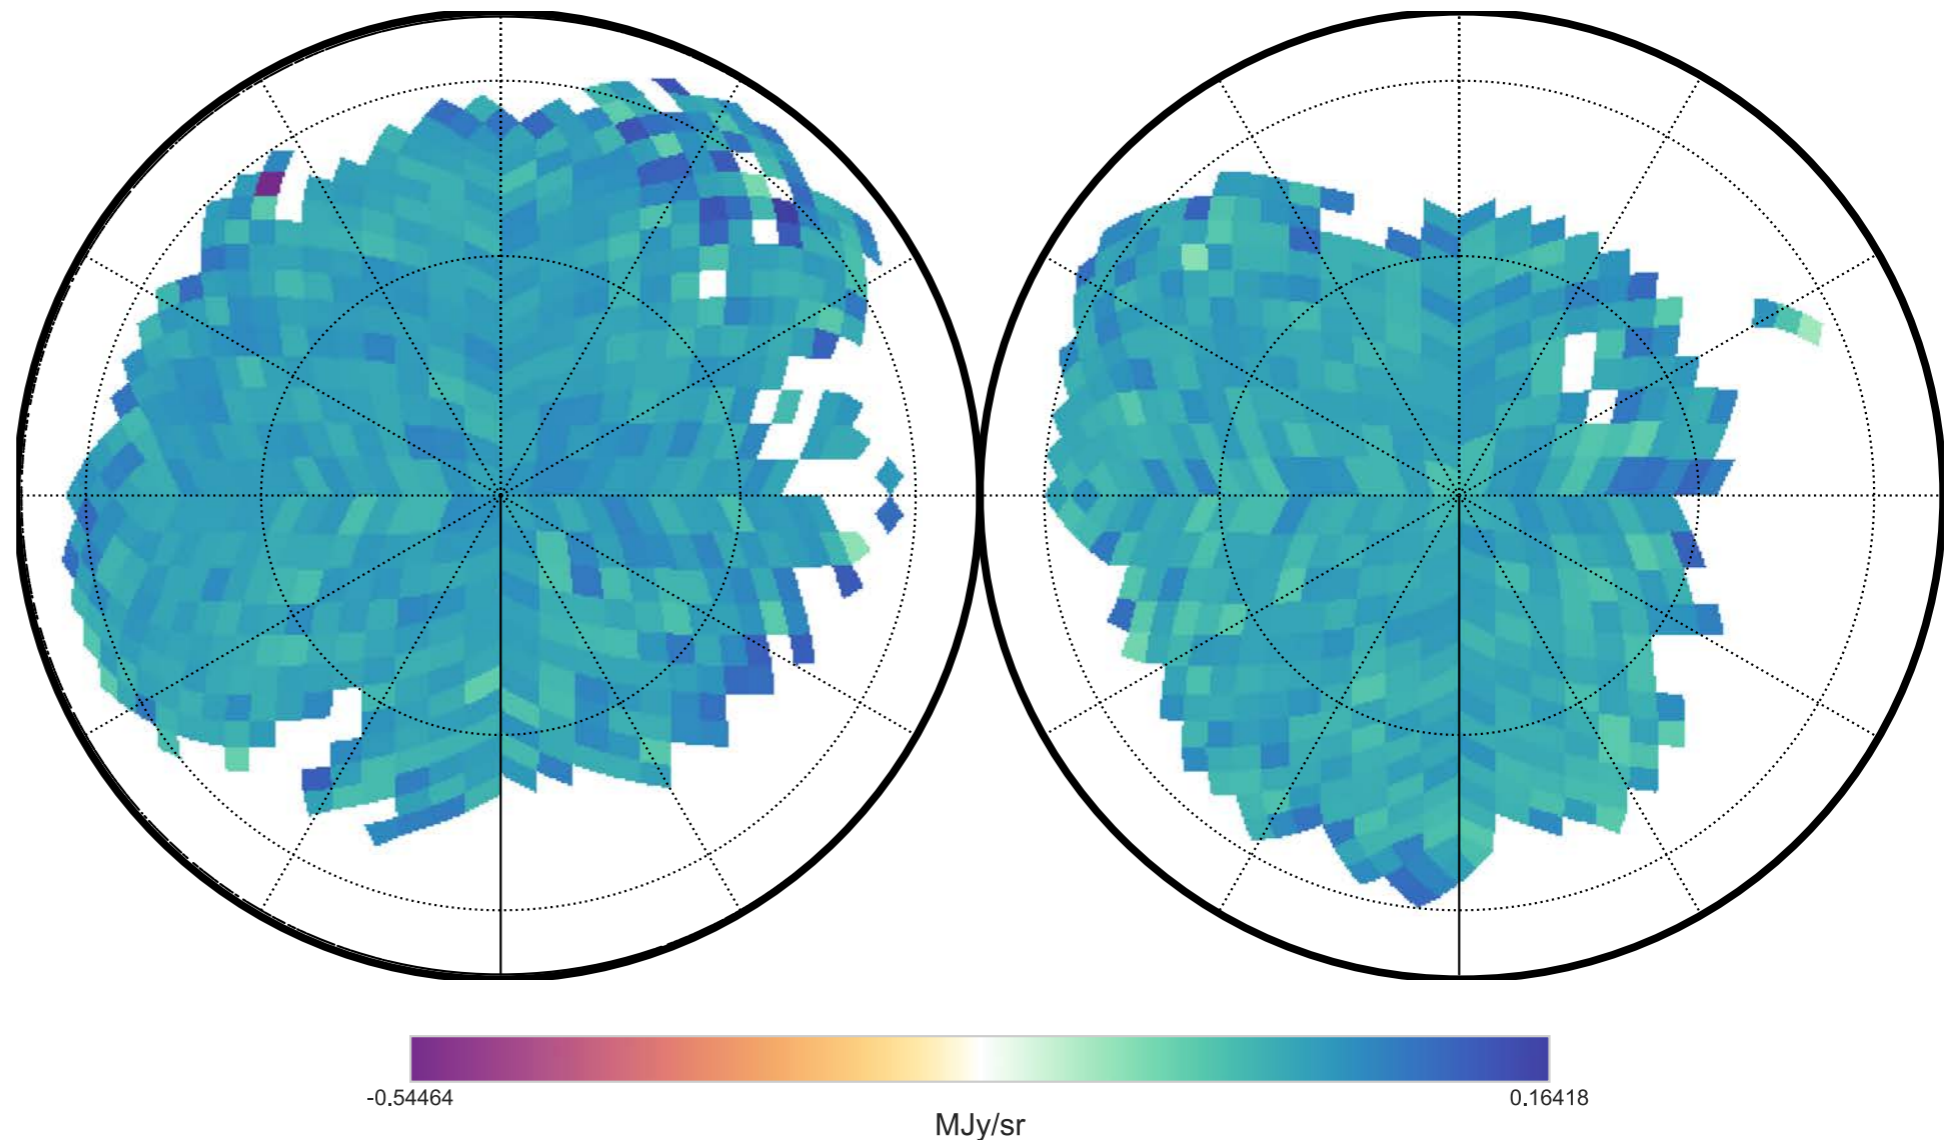

# Large-scale bias

- ❖ Separating one region at a time removes large-scale power
- ❖ Essential for CIB reconstruction at low  $l$

# Spatial selection

Offsets in the HI/  
dust correlation

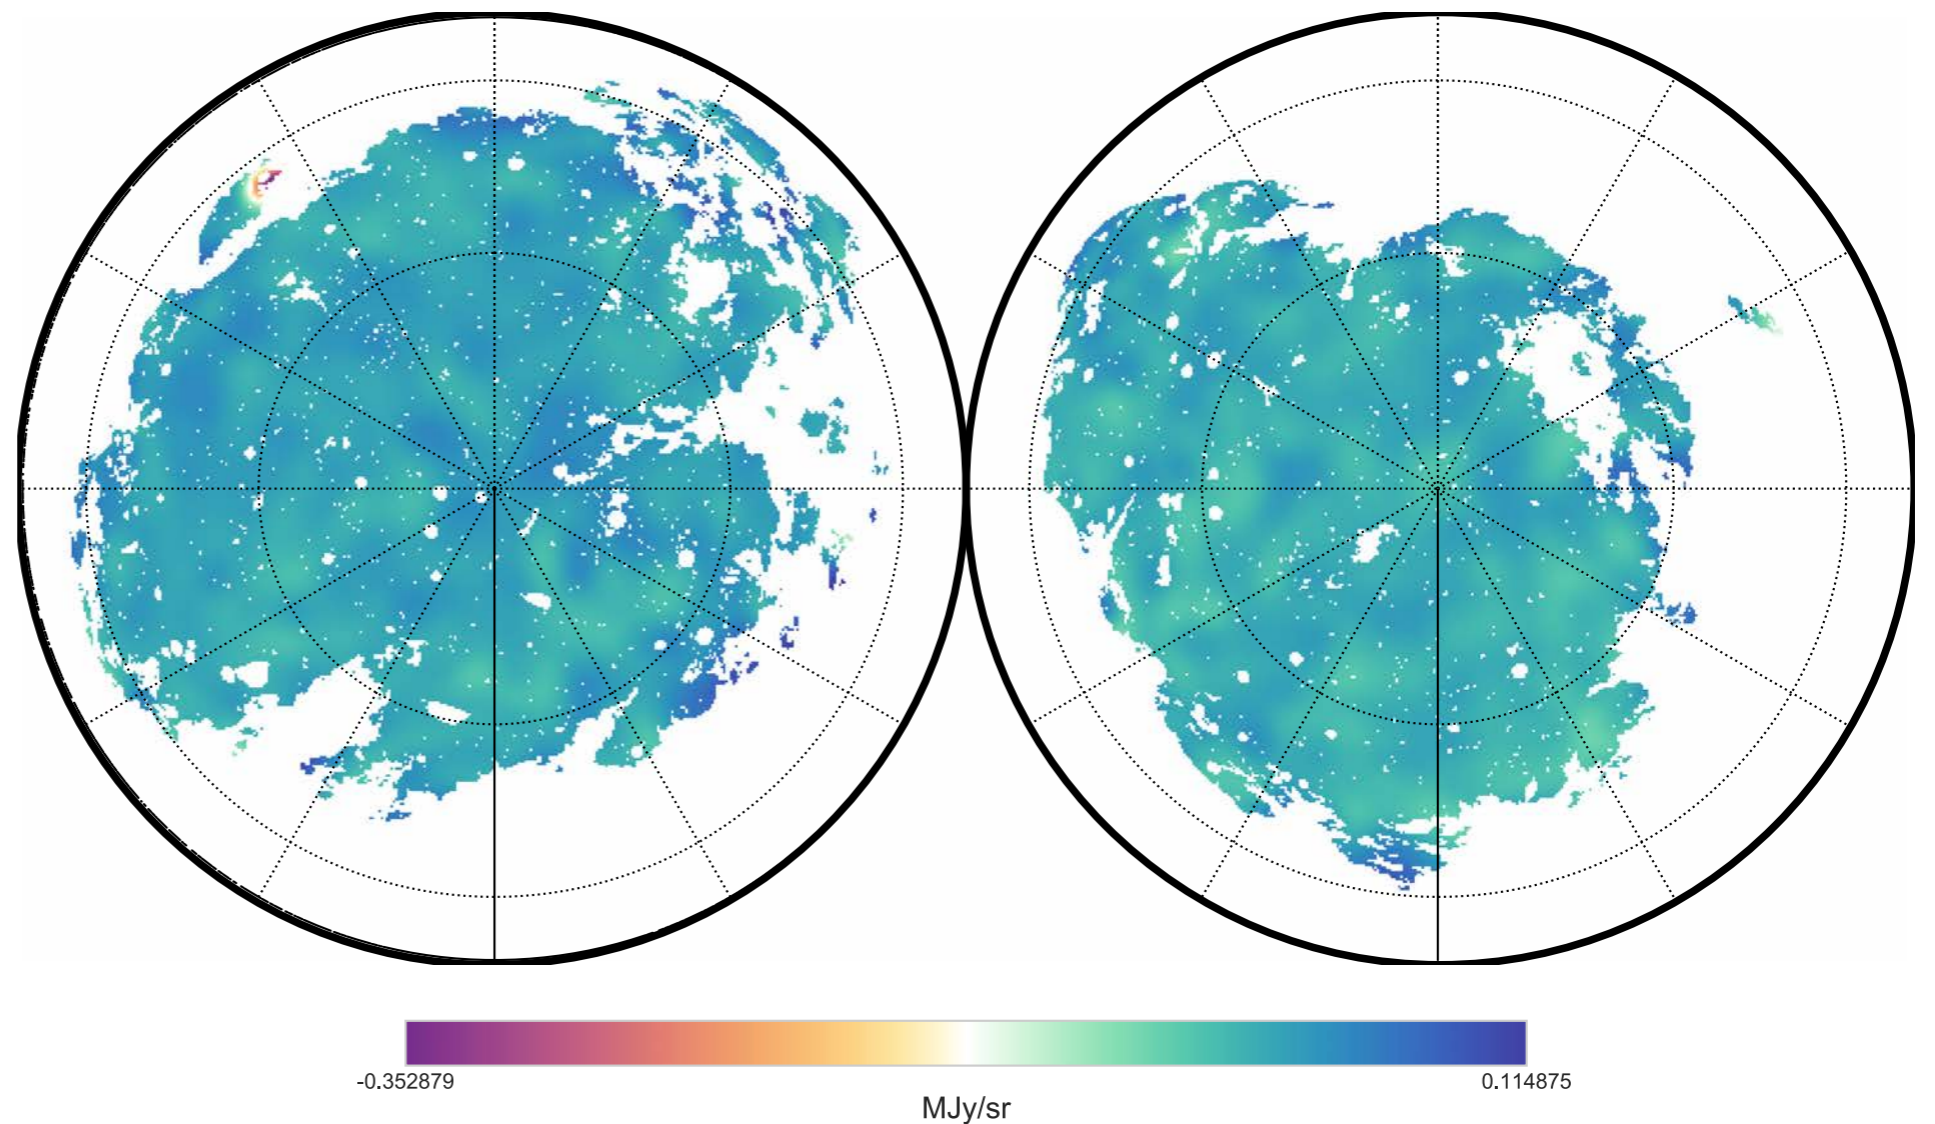

- ❖ Build dust models that preserve large-scale power
- ❖ Use consistency checks and cross correlations
- ❖ Difficult trade-off!

# Spatial selection

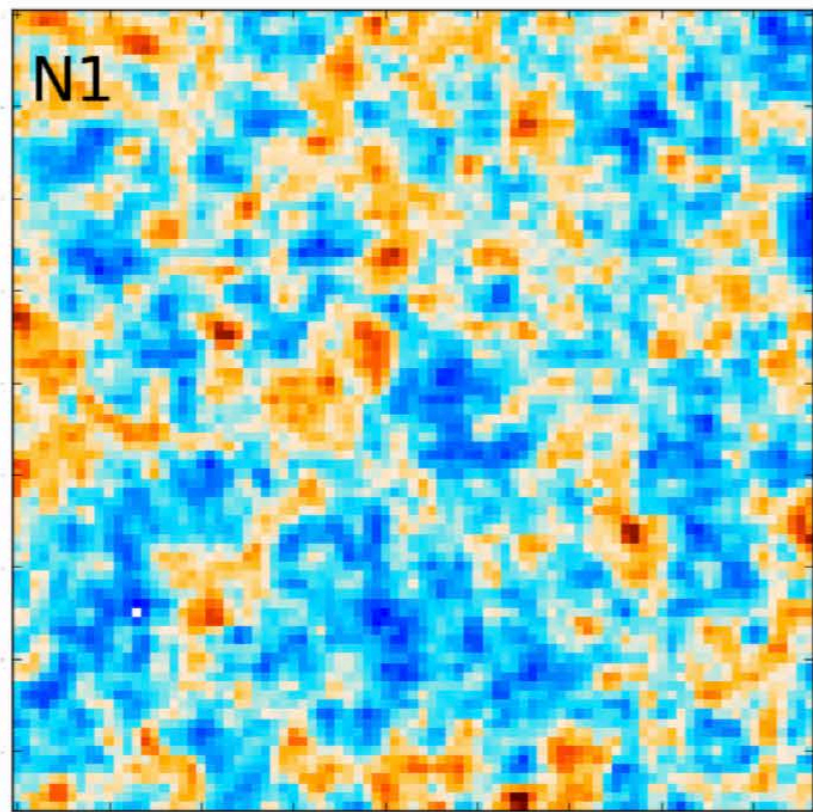

Offsets in the HI/  
dust correlation  
(smoothed)

- ❖ Build dust models that preserve large-scale power
- ❖ Use consistency checks and cross correlations
- ❖ Difficult trade-off!

# Based on spatial information: GNILC

CIB 2013 [MJy sr<sup>-1</sup>]

CIB GNILC [MJy sr<sup>-1</sup>]

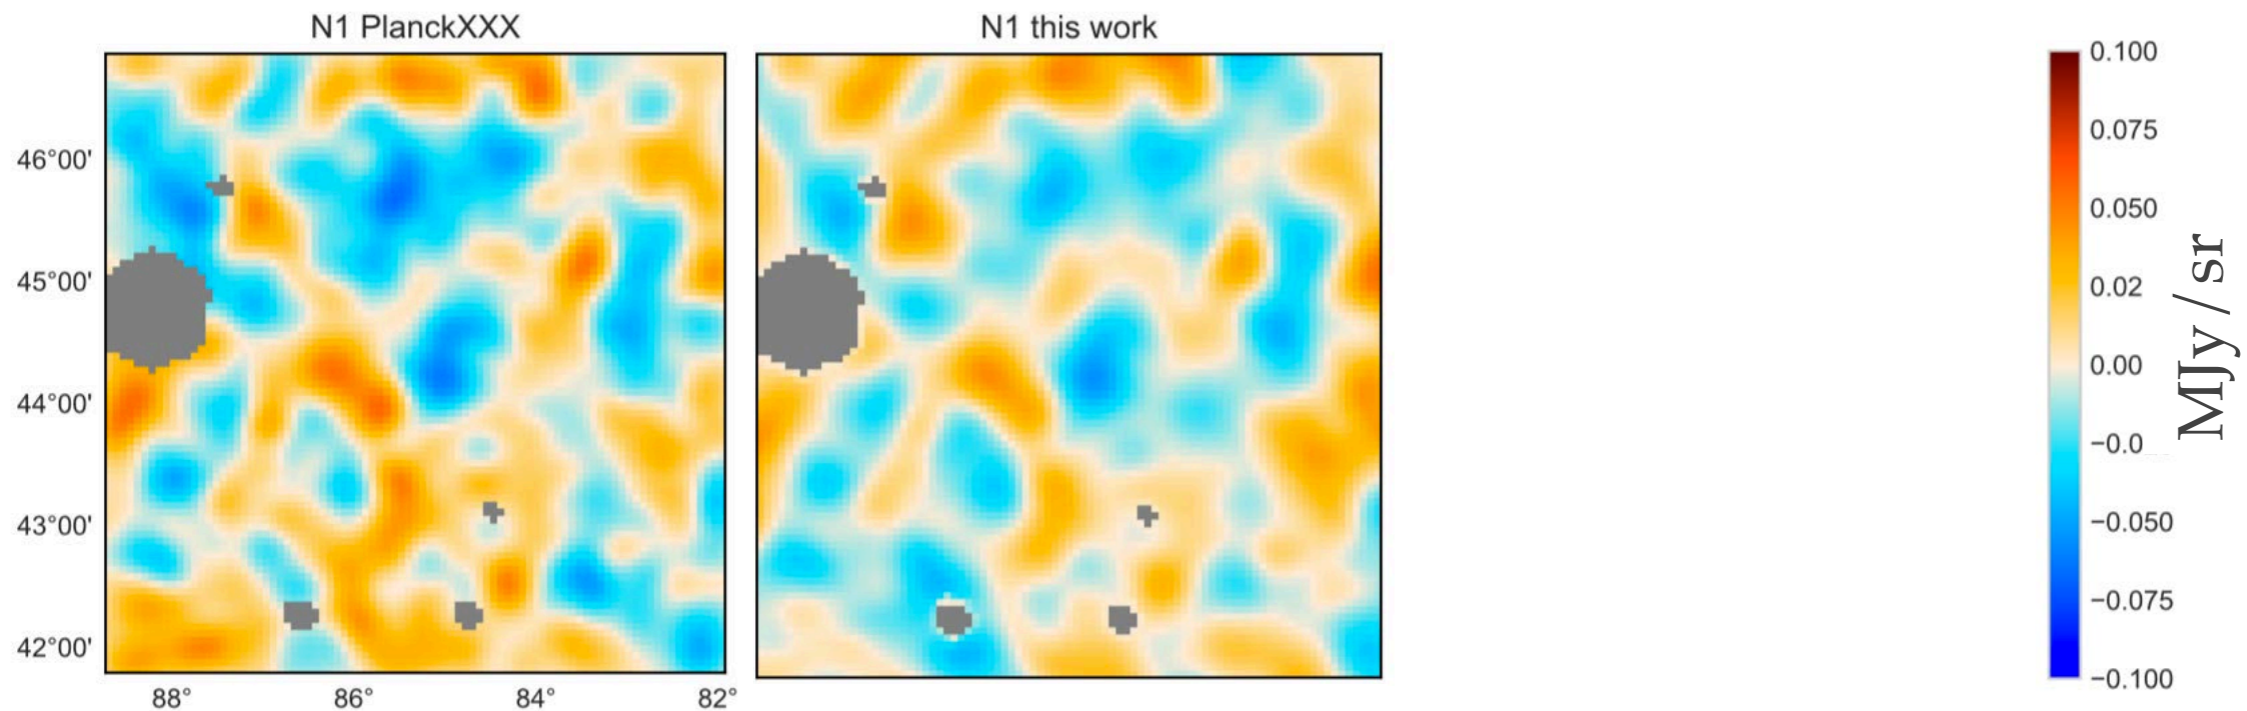

(CIB 2013 – CIB GNILC) [MJy sr<sup>-1</sup>]

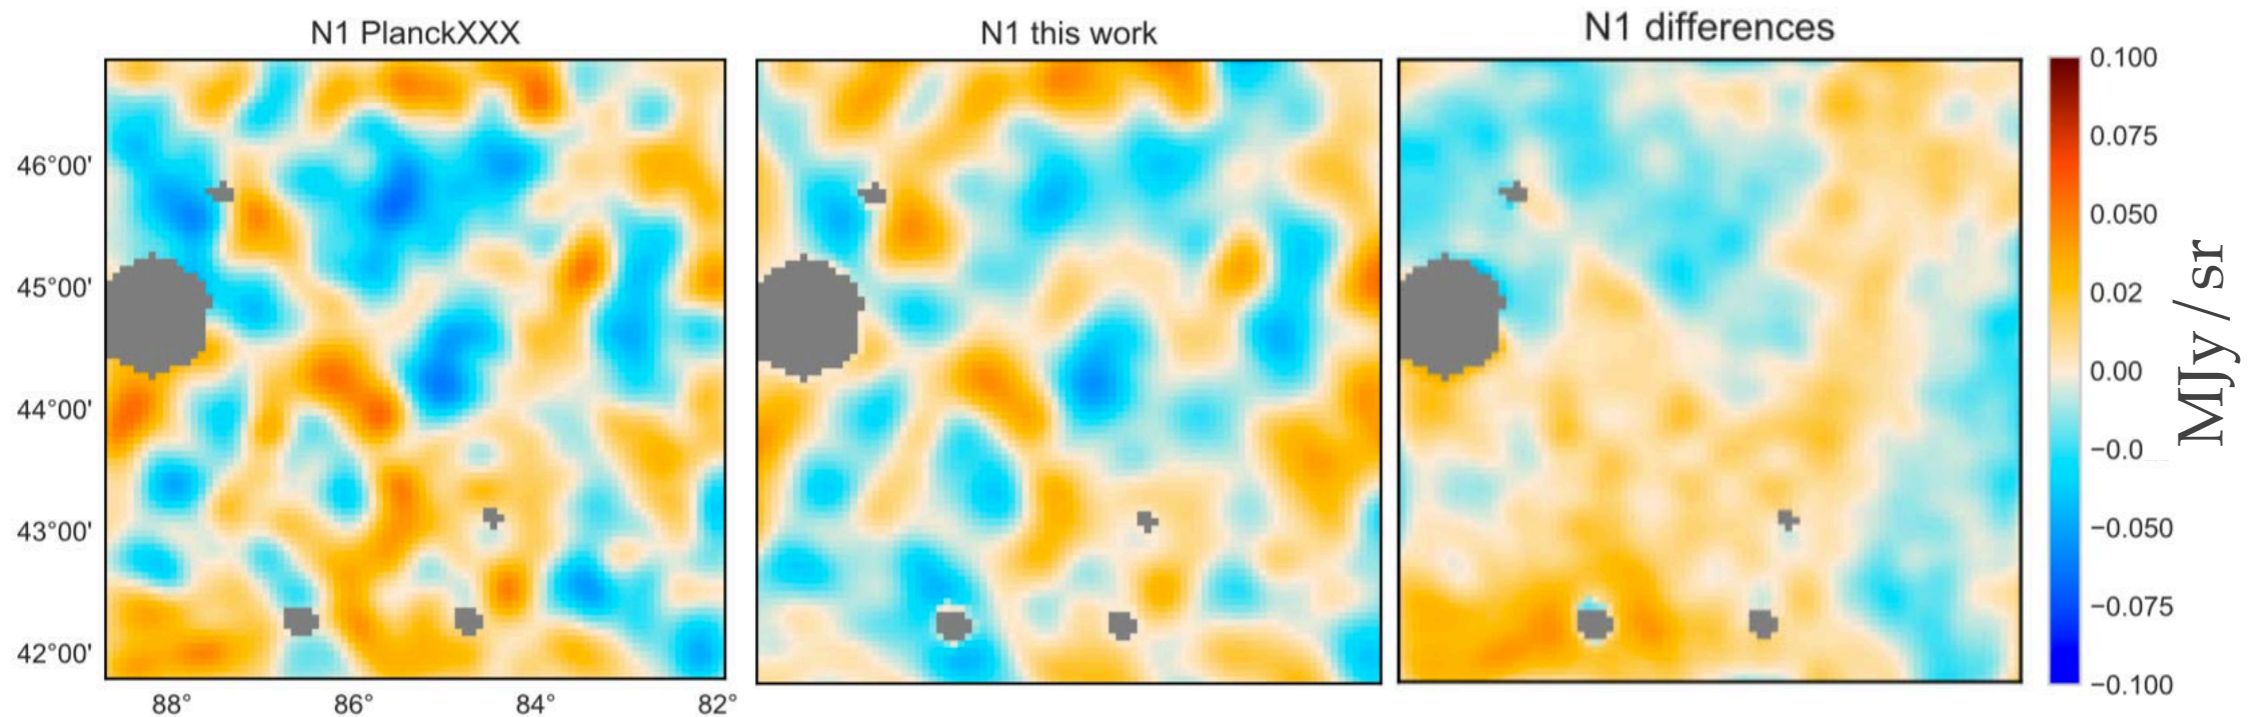

Planck (2016 XLVIII)

# Comparison to earlier work: Small fields

- ❖ Very similar morphologies despite totally different spatial selections
- ❖ Yet differences remain!

# Comparison to earlier work: Small fields

- ❖ Very similar morphologies despite totally different spatial selections
- ❖ Yet differences remain!

# Comparison to earlier work: Small fields

- ❖ Differences can be partially attributed to the underlying HI data
- ❖ Radial velocity cuts have strong effect

# Comparison to earlier work: Large field
