

Model-free and Model-based Learning as Joint Drivers of Investor Behavior

Nicholas Barberis and Lawrence Jin

May 2021*

Abstract

In the past decade, researchers in psychology and neuroscience studying human decision-making have increasingly adopted a framework that combines two systems, namely “model-free” and “model-based” learning. We import this framework into a simple financial setting, study its implications, and link it to a wide range of applications. We show that it provides a foundation for extrapolative demand and experience effects; resolves a puzzling disconnect between investor allocations and beliefs in both the frequency domain and the cross-section; and can help capture the primary role of individual fixed effects in explaining the variation in investor beliefs. More broadly, the framework offers a way of thinking about investor behavior that is grounded in recent evidence on the computations that the brain makes when estimating the values of different courses of action.
