## Building a particle physics model

#### Minimal input ansatz:

left-right symmetric algebra

$$\mathcal{A}_{LR} = \mathbb{C} \oplus \mathbb{H}_L \oplus \mathbb{H}_R \oplus M_3(\mathbb{C})$$

- involution  $(\lambda, q_L, q_R, m) \mapsto (\bar{\lambda}, \bar{q}_L, \bar{q}_R, m^*)$
- ullet subalgebra  $\mathbb{C} \oplus M_3(\mathbb{C})$  integer spin  $\mathbb{C}$ -alg
- ullet subalgebra  $\mathbb{H}_L \oplus \mathbb{H}_R$  half-integer spin  $\mathbb{R}$ -alg

#### More general choices of initial ansatz:

 A.Chamseddine, A.Connes, Why the Standard Model, J.Geom.Phys. 58 (2008) 38–47

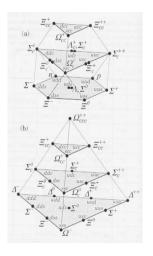

Slogan: algebras better than Lie algebras, more constraints on reps

#### Comment: associative algebras versus Lie algebras

- In geometry of gauge theories: bundle over spacetime, connections and sections, automorphisms gauge group: Lie group
- Decomposing composite particles into elementary particles:
   Lie group representations (hadrons and quarks)
- If want only elementary particles: associative algebras have very few representations (very constrained choice)
- Get gauge groups later from inner automorphisms

## Example Composite particles (baryons)

Classification in terms of elementary particles (quarks) using representations of Lie groups: SU(3)

Adjoint action:  $\mathcal{M}$  bimodule over  $\mathcal{A}$ ,  $u \in \mathcal{U}(\mathcal{A})$  unitary

$$\mathrm{Ad}(u)\xi = u\xi u^* \quad \forall \xi \in \mathcal{M}$$

Odd bimodule:  $\mathcal{M}$  bimodule for  $\mathcal{A}_{LR}$  odd iff s=(1,-1,-1,1) acts by Ad(s)=-1

$$\Leftrightarrow$$
 Rep of  $\mathcal{B}=(\mathcal{A}_{LR}\otimes_{\mathbb{R}}\mathcal{A}_{LR}^{op})_p$  as  $\mathbb{C}$ -algebra  $p=\frac{1}{2}(1-s\otimes s^0)$ , with  $\mathcal{A}^0=\mathcal{A}^{op}$ 

$$\mathcal{B} = \oplus^{4-times} M_2(\mathbb{C}) \oplus M_6(\mathbb{C})$$

Contragredient bimodule of  $\mathcal{M}$ 

$$\mathcal{M}^0 = \{ \bar{\xi} \; ; \; \xi \in \mathcal{M} \} \, , \quad a \, \bar{\xi} \, b = \, \overline{b^* \xi \, a^*}$$

#### The bimodule $\mathcal{M}_F$

 $\mathcal{M}_F = \mathsf{sum} \; \mathsf{of} \; \mathsf{all} \; \mathsf{inequivalent} \; \mathsf{irreducible} \; \mathsf{odd} \; \mathcal{A}_{\mathit{LR}}\mathsf{-bimodules}$ 

- $\dim_{\mathbb{C}} \mathcal{M}_F = 32$
- $\mathcal{M}_F = \mathcal{E} \oplus \mathcal{E}^0$

$$\mathcal{E} = \mathbf{2}_L \otimes \mathbf{1}^0 \oplus \mathbf{2}_R \otimes \mathbf{1}^0 \oplus \mathbf{2}_L \otimes \mathbf{3}^0 \oplus \mathbf{2}_R \otimes \mathbf{3}^0$$

•  $\mathcal{M}_F\cong\mathcal{M}_F^0$  by antilinear  $J_F(\xi,\bar{\eta})=(\eta,\bar{\xi})$  for  $\xi\,,\;\eta\in\mathcal{E}$ 

$$J_F^2 = 1$$
,  $\xi b = J_F b^* J_F \xi$   $\xi \in \mathcal{M}_F$ ,  $b \in \mathcal{A}_{LR}$ 

ullet Sum irreducible representations of  ${\cal B}$ 

$$\mathbf{2}_L \otimes \mathbf{1}^0 \oplus \mathbf{2}_R \otimes \mathbf{1}^0 \oplus \mathbf{2}_L \otimes \mathbf{3}^0 \oplus \mathbf{2}_R \otimes \mathbf{3}^0$$

$$\oplus \mathbf{1} \otimes \mathbf{2}_{L}^{0} \oplus \mathbf{1} \otimes \mathbf{2}_{R}^{0} \oplus \mathbf{3} \otimes \mathbf{2}_{L}^{0} \oplus \mathbf{3} \otimes \mathbf{2}_{R}^{0}$$

ullet Grading:  $\gamma_{\it F}=\,c\,-\,J_{\it F}\,c\,J_{\it F}$  with  $c=(0,1,-1,0)\in{\cal A}_{\it LR}$ 

$$J_F^2 = 1$$
,  $J_F \gamma_F = -\gamma_F J_F$ 

Grading and KO-dimension: commutations  $\Rightarrow$  KO-dim 6, mod 8

## *KO*-dimension $n \in \mathbb{Z}/8\mathbb{Z}$

antilinear isometry  $J:\mathcal{H} o \mathcal{H}$ 

$$J^2 = \varepsilon$$
,  $JD = \varepsilon' DJ$ , and  $J\gamma = \varepsilon'' \gamma J$ 

n	0	1	2	3	4	5	6	7
ε	1	1	-1	-1	-1	-1	1	1
$\varepsilon'$	1	-1	1	1	1	-1	1	1
$\varepsilon$ $\varepsilon'$ $\varepsilon''$	1		-1		1		-1	

In particular,  $J^2=1$  and  $J\gamma=-\gamma\,J$  gives KO-dim = 6 So in this case *metric dimension* is zero but KO-dimension is 6

## Interpretation as particles (Fermions)

$$q(\lambda) = \left(egin{array}{cc} \lambda & 0 \ 0 & ar{\lambda} \end{array}
ight) \qquad q(\lambda)|\uparrow
angle = \lambda|\uparrow
angle, \qquad q(\lambda)|\downarrow
angle = ar{\lambda}|\downarrow
angle$$

- $\mathbf{2}_L \otimes \mathbf{1}^0$ : neutrinos  $\nu_L \in |\uparrow\rangle_L \otimes \mathbf{1}^0$  and charged leptons  $e_L \in |\downarrow\rangle_L \otimes \mathbf{1}^0$
- $\mathbf{2}_R \otimes \mathbf{1}^0$ : right-handed neutrinos  $\nu_R \in |\uparrow\rangle_R \otimes \mathbf{1}^0$  and charged leptons  $e_R \in |\downarrow\rangle_R \otimes \mathbf{1}^0$
- $\mathbf{2}_L \otimes \mathbf{3}^0$  (color indices):  $\mathbf{u}/\mathbf{c}/\mathbf{t}$  quarks  $u_L \in |\uparrow\rangle_L \otimes \mathbf{3}^0$  and  $\mathbf{d}/\mathbf{s}/\mathbf{b}$  quarks  $d_L \in |\downarrow\rangle_L \otimes \mathbf{3}^0$
- $\mathbf{2}_R \otimes \mathbf{3}^0$  (color indices):  $\mathbf{u}/\mathbf{c}/\mathbf{t}$  quarks  $u_R \in |\uparrow\rangle_R \otimes \mathbf{3}^0$  and  $\mathbf{d}/\mathbf{s}/\mathbf{b}$  quarks  $d_R \in |\downarrow\rangle_R \otimes \mathbf{3}^0$
- $\mathbf{1} \otimes \mathbf{2}_{L,R}^0$ : antineutrinos  $\bar{\nu}_{L,R} \in \mathbf{1} \otimes \uparrow \rangle_{L,R}^0$ , and charged antileptons  $\bar{e}_{L,R} \in \mathbf{1} \otimes |\downarrow \rangle_{L,R}^0$
- $\mathbf{3} \otimes \mathbf{2}_{L,R}^0$  (color indices): antiquarks  $\bar{u}_{L,R} \in \mathbf{3} \otimes |\uparrow\rangle_{L,R}^0$  and  $\bar{d}_{L,R} \in \mathbf{3} \otimes |\downarrow\rangle_{L,R}^0$

## Subalgebra and order one condition:

N=3 generations (input):  $\mathcal{H}_F=\mathcal{M}_F\oplus\mathcal{M}_F\oplus\mathcal{M}_F$ 

Left action of  $\mathcal{A}_{LR}$  sum of representations  $\pi|_{\mathcal{H}_f} \oplus \pi'|_{\mathcal{H}_{\bar{f}}}$  with  $\mathcal{H}_f = \mathcal{E} \oplus \mathcal{E} \oplus \mathcal{E}$  and  $\mathcal{H}_{\bar{f}} = \mathcal{E}^0 \oplus \mathcal{E}^0 \oplus \mathcal{E}^0$  and with no equivalent subrepresentations (disjoint)

If D mixes  $\mathcal{H}_f$  and  $\mathcal{H}_{ar{f}} \Rightarrow$  no order one condition for  $\mathcal{A}_{LR}$ 

Problem for coupled pair:  $A \subset A_{LR}$  and D with off diagonal terms maximal A where order one condition holds

$$\mathcal{A}_F = \{(\lambda, q_L, \lambda, m) \mid \lambda \in \mathbb{C}, \ q_L \in \mathbb{H}, \ m \in M_3(\mathbb{C})\}$$
$$\sim \mathbb{C} \oplus \mathbb{H} \oplus M_3(\mathbb{C}).$$

unique up to  $Aut(A_{LR})$ 

⇒ spontaneous breaking of LR symmetry

## Subalgebras with off diagonal Dirac and order one condition

Operator  $T: \mathcal{H}_f o \mathcal{H}_{ar{f}}$ 

$$\mathcal{A}(T) = \{b \in \mathcal{A}_{LR} \mid \pi'(b)T = T\pi(b),$$
  
$$\pi'(b^*)T = T\pi(b^*)\}$$

involutive unital subalgebra of  $\mathcal{A}_{LR}$ 

 $\mathcal{A} \subset \mathcal{A}_{LR}$  involutive unital subalgebra of  $\mathcal{A}_{LR}$ 

- ullet restriction of  $\pi$  and  $\pi'$  to  $\mathcal A$  disjoint  $\Rightarrow$  no off diag D for  $\mathcal A$
- $\exists$  off diag D for  $A \Rightarrow$  pair e, e' min proj in commutants of  $\pi(A_{LR})$  and  $\pi'(A_{LR})$  and operator T

$$e'Te = T \neq 0$$
 and  $A \subset A(T)$ 

• Then case by case analysis to identify max dimensional

#### **Symmetries**

Up to a finite abelian group

$$\mathrm{SU}(\mathcal{A}_F) \sim \mathrm{U}(1) \times \mathrm{SU}(2) \times \mathrm{SU}(3)$$

Adjoint action of U(1) (in powers of  $\lambda \in U(1)$ )

$$\uparrow \otimes \mathbf{1}^{0} \quad \downarrow \otimes \mathbf{1}^{0} \quad \uparrow \otimes \mathbf{3}^{0} \quad \downarrow \otimes \mathbf{3}^{0}$$

$$\mathbf{2}_{L} \quad -1 \quad -1 \quad \frac{1}{3} \quad \frac{1}{3}$$

$$\mathbf{2}_{R} \quad 0 \quad -2 \quad \frac{4}{3} \quad -\frac{2}{3}$$

 $\Rightarrow$  correct hypercharges of fermions (confirms identification of  $\mathcal{H}_F$  basis with fermions)

Classifying Dirac operators for  $(A_F, \mathcal{H}_F, \gamma_F, J_F)$  all possible  $D_F$  self adjoint on  $\mathcal{H}_F$ , commuting with  $J_F$ , anticommuting with  $\gamma_F$  and  $[[D, a], b^0] = 0$ ,  $\forall a, b \in \mathcal{A}_F$  Input conditions (massless photon): commuting with subalgebra

$$\mathbb{C}_F \subset \mathcal{A}_F \,, \quad \mathbb{C}_F = \{(\lambda, \lambda, 0) \,, \lambda \in \mathbb{C}\}$$
 then  $D(Y) = \begin{pmatrix} S & T^* \\ T & \bar{S} \end{pmatrix}$  with  $S = S_1 \oplus (S_3 \otimes 1_3)$  
$$S_1 = \begin{pmatrix} 0 & 0 & Y^*_{(\uparrow 1)} & 0 \\ 0 & 0 & 0 & Y^*_{(\downarrow 1)} \\ Y_{(\uparrow 1)} & 0 & 0 & 0 \\ 0 & Y_{(\downarrow 1)} & 0 & 0 \end{pmatrix}$$

same for  $S_3$ , with  $Y_{(\downarrow 1)}$ ,  $Y_{(\uparrow 1)}$ ,  $Y_{(\downarrow 3)}$ ,  $Y_{(\uparrow 3)} \in GL_3(\mathbb{C})$  and  $Y_R$  symmetric:

$$T: E_R = \uparrow_R \otimes \mathbf{1}^0 \to J_F E_R$$

Moduli space  $C_3 \times C_1$   $C_3 = pairs (Y_{(\downarrow 3)}, Y_{(\uparrow 3)})$  modulo

$$Y'_{(\downarrow 3)} = W_1 Y_{(\downarrow 3)} W_3^*, \quad Y'_{(\uparrow 3)} = W_2 Y_{(\uparrow 3)} W_3^*$$

 $W_j$  unitary matrices

$$\mathcal{C}_3 = (K \times K) \backslash (G \times G) / K$$

 $G = GL_3(\mathbb{C})$  and K = U(3) dim<sub> $\mathbb{R}$ </sub>  $C_3 = 10 = 3 + 3 + 4$  (3 + 3 eigenvalues, 3 angles, 1 phase)

 $\mathcal{C}_1 = ext{triplets} \; (Y_{(\downarrow 1)}, Y_{(\uparrow 1)}, Y_R) \; ext{with} \; Y_R \; ext{symmetric modulo}$ 

$$Y'_{(\downarrow 1)} = V_1 Y_{(\downarrow 1)} V_3^*, \quad Y'_{(\uparrow 1)} = V_2 Y_{(\uparrow 1)} V_3^*, \quad Y'_R = V_2 Y_R \bar{V}_2^*$$

 $\pi: \mathcal{C}_1 \to \mathcal{C}_3$  surjection forgets  $Y_R$  fiber symmetric matrices mod  $Y_R \mapsto \lambda^2 Y_R \quad \dim_{\mathbb{R}}(\mathcal{C}_3 \times \mathcal{C}_1) = 31$  (dim fiber 12-1=11)

Physical interpretation: Yukawa parameters and Majorana masses Representatives in  $C_3 \times C_1$ :

$$Y_{(\uparrow 3)} = \delta_{(\uparrow 3)}$$
  $Y_{(\downarrow 3)} = U_{CKM} \, \delta_{(\downarrow 3)} \, U_{CKM}^*$   $Y_{(\uparrow 1)} = U_{PMNS}^* \, \delta_{(\uparrow 1)} \, U_{PMNS}$   $Y_{(\downarrow 1)} = \delta_{(\downarrow 1)}$ 

 $\delta_{\uparrow}$ ,  $\delta_{\downarrow}$  diagonal: Dirac masses

$$U = \begin{pmatrix} c_1 & -s_1c_3 & -s_1s_3 \\ s_1c_2 & c_1c_2c_3 - s_2s_3e_\delta & c_1c_2s_3 + s_2c_3e_\delta \\ s_1s_2 & c_1s_2c_3 + c_2s_3e_\delta & c_1s_2s_3 - c_2c_3e_\delta \end{pmatrix}$$

angles and phase  $c_i = \cos \theta_i$ ,  $s_i = \sin \theta_i$ ,  $e_{\delta} = \exp(i\delta)$ 

 $U_{CKM} = Cabibbo-Kobayashi-Maskawa$ 

 $U_{PMNS} = Pontecorvo-Maki-Nakagawa-Sakata$ 

⇒ neutrino mixing

 $Y_R$  = Majorana mass terms for right-handed neutrinos

#### Geometric point of view:

- CKM and PMNS matrices data: coordinates on moduli space of Dirac operators
- Experimental constraints define subvarieties in the moduli space
- Symmetric spaces  $(K \times K) \setminus (G \times G)/K$  interesting geometry
- Get parameter relations from "interesting subvarieties"?

Summary: matter content of the NCG model

 ${
m {\it v}MSM}$ : Minimal Standard Model with additional right handed neutrinos with Majorana mass terms

Free parameters in the model:

- 3 coupling constants
- 6 quark masses, 3 mixing angles, 1 complex phase
- 3 charged lepton masses, 3 lepton mixing angles, 1 complex phase
- 3 neutrino masses
- 11 Majorana mass matrix parameters
- 1 QCD vacuum angle

Moduli space of Dirac operators on the finite NC space F: all masses, mixing angles, phases, Majorana mass terms Other parameters:

- coupling constants: product geometry and action functional
- vacuum angle not there (but quantum corrections...?)

#### Symmetries and NCG

Symmetries of gravity coupled to matter:

$$G = U(1) \times SU(2) \times SU(3)$$

$$\mathcal{G} = \operatorname{Map}(M, G) \rtimes \operatorname{Diff}(M)$$

Is it  $\mathcal{G} = \mathrm{Diff}(X)$ ? Not for a manifold, yes for an NC space

Example: 
$$A = C^{\infty}(M, M_n(\mathbb{C}))$$
  $G = PSU(n)$ 

$$1 o \operatorname{Inn}(\mathcal{A}) o \operatorname{Aut}(\mathcal{A}) o \operatorname{Out}(\mathcal{A}) o 1$$

$$1 \to \operatorname{Map}(M, G) \to \mathcal{G} \to \operatorname{Diff}(M) \to 1.$$

- Symmetries viewpoint: can think of  $X = M \times F$  noncommutative with  $\mathcal{G} = \mathrm{Diff}(X)$  pure gravity symmetries for X combining gravity and gauge symmetries together (no a priori distinction between "base" and "fiber" directions)
- Want same with action functional for pure gravity on NC space  $X = M \times F$  giving gravity coupled to matter on M

#### Product geometry $M \times F$

Two spectral triples  $(A_i, \mathcal{H}_i, D_i, \gamma_i, J_i)$  of KO-dim 4 and 6:

$$\mathcal{A} = \mathcal{A}_1 \otimes \mathcal{A}_2 \quad \mathcal{H} = \mathcal{H}_1 \otimes \mathcal{H}_2$$

$$D = D_1 \otimes 1 + \gamma_1 \otimes D_2$$

$$\gamma = \gamma_1 \otimes \gamma_2 \quad J = J_1 \otimes J_2$$

Case of 4-dimensional spin manifold M and finite NC geometry F:

$$\mathcal{A} = C^{\infty}(M) \otimes \mathcal{A}_F = C^{\infty}(M, \mathcal{A}_F)$$
 $\mathcal{H} = L^2(M, S) \otimes \mathcal{H}_F = L^2(M, S \otimes \mathcal{H}_F)$ 
 $D = \partial_M \otimes 1 + \gamma_5 \otimes D_F$ 

 $D_F$  chosen in the moduli space described last time

Dimension of NC spaces: different notions of dimension for a spectral triple  $(\mathcal{A}, \mathcal{H}, D)$ 

- Metric dimension: growth of eigenvalues of Dirac operator
- KO-dimension (mod 8): sign commutation relations of J,  $\gamma$ , D
- Dimension spectrum: poles of zeta functions  $\zeta_{a,D}(s) = \text{Tr}(a|D|^{-s})$

For manifolds first two agree and third contains usual dim; for NC spaces not same: DimSp  $\subset \mathbb{C}$  can have non-integer and non-real points, KO not always metric dim mod 8, see F case

 $X = M \times F$  metrically four dim 4 = 4 + 0; KO-dim is 10 = 4 + 6 (equal 2 mod 8); DimSp  $k \in \mathbb{Z}_{\geq 0}$  with  $k \leq 4$ 

#### Variant: almost commutative geometries

$$(C^{\infty}(M,\mathcal{E}),L^2(M,\mathcal{E}\otimes S),\mathcal{D}_{\mathcal{E}})$$

- M smooth manifold,  $\mathcal E$  algebra bundle: fiber  $\mathcal E_x$  finite dimensional algebra  $\mathcal A_F$
- ullet  $C^{\infty}(M,\mathcal{E})$  smooth sections of a algebra bundle  $\mathcal{E}$
- Dirac operator  $\mathcal{D}_{\mathcal{E}} = c \circ (\nabla^{\mathcal{E}} \otimes 1 + 1 \otimes \nabla^{\mathcal{S}})$  with spin connection  $\nabla^{\mathcal{S}}$  and hermitian connection on bundle
- Compatible grading and real structure

An equivalent intrinsic (abstract) characterization in:

 Branimir Ćaćić, A reconstruction theorem for almost-commutative spectral triples, arXiv:1101.5908

Here we will assume for simplicity just a product  $M \times F$ 

# Inner fluctuations and gauge fields Setup:

ullet Right  ${\mathcal A}$ -module structure on  ${\mathcal H}$ 

$$\xi b = b^0 \xi, \quad \xi \in \mathcal{H}, \quad b \in \mathcal{A}$$

Unitary group, adjoint representation:

$$\xi \in \mathcal{H} \to \mathrm{Ad}(u)\,\xi = u\,\xi\,u^* \quad \xi \in \mathcal{H}$$

Inner fluctuations:

$$D \to D_A = D + A + \varepsilon' J A J^{-1}$$

with  $A = A^*$  self-adjoint operator of the form

$$A = \sum a_j[D, b_j], \quad a_j, b_j \in A$$

Note: not an equivalence relation (finite geometry, can fluctuate D to zero) but like "self Morita equivalences"

## Properties of inner fluctuations $(A, \mathcal{H}, D, J)$

- Gauge potential  $A \in \Omega^1_D$ ,  $A = A^*$
- Unitary  $u \in \mathcal{A}$ , then

$$\mathrm{Ad}(u)(D+A+\varepsilon'\,J\,A\,J^{-1})\mathrm{Ad}(u^*) =$$
$$D+\gamma_u(A)+\varepsilon'\,J\,\gamma_u(A)\,J^{-1}$$

where 
$$\gamma_u(A) = u[D, u^*] + uAu^*$$

ullet D'=D+A (with  $A\in\Omega^1_D$ ,  $A=A^*$ ) then

$$D'+B=D+A', \quad A'=A+B\in\Omega^1_D$$

$$\forall B \in \Omega^1_{D'} \ B = B^*$$

•  $D' = D + A + \varepsilon' J A J^{-1}$  then

$$D' + B + \varepsilon' J B J^{-1} = D + A' + \varepsilon' J A' J^{-1}$$
  $A' = A + B \in \Omega^1_D$ 

$$\forall B \in \Omega^1_{D'} \ B = B^*$$

## Gauge bosons and Higgs boson

- Unitary  $U(A) = \{u \in A \mid uu^* = u^*u = 1\}$
- Special unitary

$$SU(A_F) = \{u \in U(A_F) \mid det(u) = 1\}$$

det of action of u on  $\mathcal{H}_F$ 

Up to a finite abelian group

$$SU(A_F) \sim U(1) \times SU(2) \times SU(3)$$

- Unimod subgr of  $\mathcal{U}(\mathcal{A})$  adjoint rep  $\mathrm{Ad}(u)$  on  $\mathcal{H}$  is gauge group of SM
- Unimodular inner fluctuations (in M directions)  $\Rightarrow$  gauge bosons of SM: U(1), SU(2) and SU(3) gauge bosons
- Inner fluctuations in F direction ⇒ Higgs field

#### More on Gauge bosons

Inner fluctuations  $A^{(1,0)} = \sum_i a_i [\partial_M \otimes 1, a_i']$  with with  $a_i = (\lambda_i, q_i, m_i), a_i' = (\lambda_i', q_i', m_i')$  in  $A = C^{\infty}(M, A_F)$ 

- U(1) gauge field  $\Lambda = \sum_i \lambda_i \, d\lambda_i' = \sum_i \lambda_i [\partial_M \otimes 1, \lambda_i']$
- SU(2) gauge field  $Q = \sum_i q_i dq_i'$ , with  $q = f_0 + \sum_{\alpha} i f_{\alpha} \sigma^{\alpha}$  and  $Q = \sum_{\alpha} f_{\alpha} [\partial_M \otimes 1, i f_{\alpha}' \sigma^{\alpha}]$
- U(3) gauge field  $V' = \sum_i m_i \, dm'_i = \sum_i m_i [\partial_M \otimes 1, m'_i]$
- reduce the gauge field V' to SU(3) passing to unimodular subgroup  $SU(A_F)$  and unimodular gauge potential Tr(A) = 0

$$V' = -V - \frac{1}{3} \begin{pmatrix} \Lambda & 0 & 0 \\ 0 & \Lambda & 0 \\ 0 & 0 & \Lambda \end{pmatrix} = -V - \frac{1}{3}\Lambda 1_3$$

#### Gauge bosons and hypercharges

The (1,0) part of  $A+JAJ^{-1}$  acts on quarks and leptons by

$$\begin{pmatrix} \frac{4}{3}\Lambda + V & 0 & 0 & 0 \\ 0 & -\frac{2}{3}\Lambda + V & 0 & 0 \\ 0 & 0 & Q_{11} + \frac{1}{3}\Lambda + V & Q_{12} \\ 0 & 0 & Q_{21} & Q_{22} + \frac{1}{3}\Lambda + V \end{pmatrix}$$

$$\begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & -2\Lambda & 0 & 0 \\ 0 & 0 & Q_{11} - \Lambda & Q_{12} \\ 0 & 0 & Q_{21} & Q_{22} - \Lambda \end{pmatrix}$$

⇒ correct hypercharges!

#### More on Higgs boson

Inner fluctuations  $A^{(0,1)}$  in the F-space direction

$$\sum_{i} a_{i} [\gamma_{5} \otimes D_{F}, a'_{i}](x)|_{\mathcal{H}_{f}} = \gamma_{5} \otimes (A_{q}^{(0,1)} + A_{\ell}^{(0,1)})$$

$$A_q^{(0,1)} = \left( egin{array}{cc} 0 & X \ X' & 0 \end{array} 
ight) \otimes \mathbb{1}_3 \hspace{0.5cm} A_1^{(0,1)} = \left( egin{array}{cc} 0 & Y \ Y' & 0 \end{array} 
ight)$$

$$X = \begin{pmatrix} \Upsilon_u^* \varphi_1 & \Upsilon_u^* \varphi_2 \\ -\Upsilon_d^* \bar{\varphi}_2 & \Upsilon_d^* \bar{\varphi}_1 \end{pmatrix} \quad \text{and} \quad X' = \begin{pmatrix} \Upsilon_u \varphi_1' & \Upsilon_d \varphi_2' \\ -\Upsilon_u \bar{\varphi}_2' & \Upsilon_d \bar{\varphi}_1' \end{pmatrix}$$

$$Y = \left( \begin{array}{cc} \Upsilon_{\nu}^{*}\varphi_{1} & \Upsilon_{\nu}^{*}\varphi_{2} \\ -\Upsilon_{e}^{*}\bar{\varphi}_{2} & \Upsilon_{e}^{*}\bar{\varphi}_{1} \end{array} \right) \quad \text{ and } \quad Y' = \left( \begin{array}{cc} \Upsilon_{\nu}\varphi_{1}' & \Upsilon_{e}\varphi_{2}' \\ -\Upsilon_{\nu}\bar{\varphi}_{2}' & \Upsilon_{e}\bar{\varphi}_{1}' \end{array} \right)$$

$$\varphi_{1} = \sum \lambda_{i}(\alpha'_{i} - \lambda'_{i}), \ \varphi_{2} = \sum \lambda_{i}\beta'_{i} \ \varphi'_{1} = \sum \alpha_{i}(\lambda'_{i} - \alpha'_{i}) + \beta_{i}\bar{\beta}'_{i} \text{ and }$$

$$\varphi'_{2} = \sum (-\alpha_{i}\beta'_{i} + \beta_{i}(\bar{\lambda}'_{i} - \bar{\alpha}'_{i})), \text{ for } a_{i}(x) = (\lambda_{i}, q_{i}, m_{i}) \text{ and }$$

$$a_i'(x) = (\lambda_i', q_i', m_i') \text{ and } q = \begin{pmatrix} \alpha & \beta \\ -\overline{\beta} & \overline{\alpha} \end{pmatrix}$$

More on Higgs boson

Discrete part of inner fluctuations: quaternion valued function  $H=\varphi_1+\varphi_2 j$  or  $\varphi=(\varphi_1,\varphi_2)$ 

$$\begin{split} &D_A^2 = (D^{1,0})^2 + 1_4 \otimes (D^{0,1})^2 - \gamma_5 \left[ D^{1,0}, 1_4 \otimes D^{0,1} \right] \\ &[D^{1,0}, 1_4 \otimes D^{0,1}] = \sqrt{-1} \, \gamma^{\mu} \left[ (\nabla_{\mu}^s + \mathbb{A}_{\mu}), 1_4 \otimes D^{0,1} \right] \end{split}$$

This gives  $D_A^2 = 
abla^* 
abla - E$  where  $abla^* 
abla$  Laplacian of  $abla = 
abla^s + A$ 

$$-E = rac{1}{4} s \otimes \operatorname{id} + \sum_{\mu < 
u} \gamma^{\mu} \gamma^{
u} \otimes \mathbb{F}_{\mu
u} - i \gamma_5 \gamma^{\mu} \otimes \mathbb{M}(D_{\mu}\varphi) + 1_4 \otimes (D^{0,1})^2$$

with s=-R scalar curvature and  $\mathbb{F}_{\mu\nu}$  curvature of  $\mathbb{A}$ 

$$D_{\mu}\varphi = \partial_{\mu}\varphi + \frac{i}{2}g_{2}W_{\mu}^{\alpha}\varphi\,\sigma^{\alpha} - \frac{i}{2}g_{1}B_{\mu}\,\varphi$$

SU(2) and U(1) gauge potentials
