# Update on LYSO Development

**Ren-Yuan Zhu**

**California Institute of Technology**

November 8, 2011

# Introduction

LSO/LYSO is a bright (200 times of PWO) and fast (40 ns) crystal scintillator. It has been widely used in medical industry. Its mechanical characteristics allows it be used in various forms for different calorimeter designs.

Supported by DOE ADR and US CMS Upgrade Effort the Caltech group has been investigating this material for HEP applications since 2005. It was found that its radiation hardness is excellent against  $\gamma$ -ray, neutrons and high energy protons (ETH data). No recovery, so calibration is less complicated. As a result, LYSO is now base-lined for the Mu2e and SuperB experiments.

# LSO & LYSO Crystal Samples

2.5 x 2.5 x 20 cm (18 X<sub>0</sub>)

CTI LSO

CPI LYSO

Saint-Gobain LYSO

SIPAT-LYSO

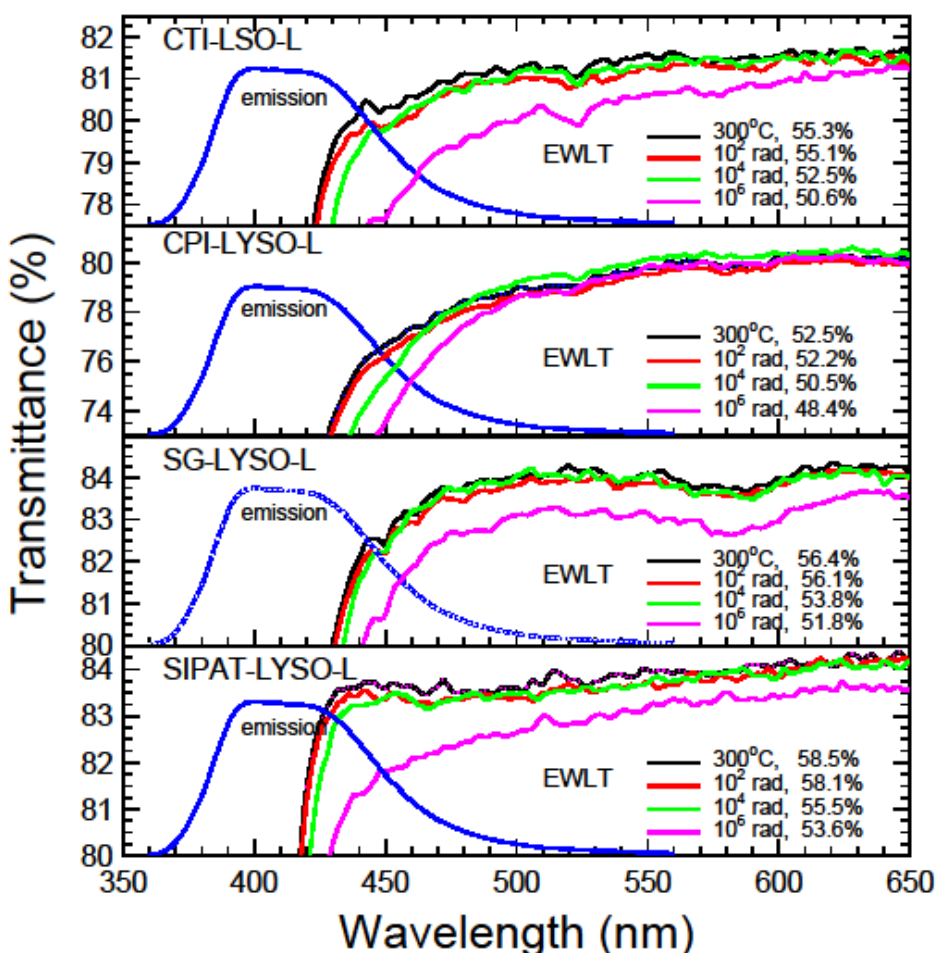

# 20 cm Long LSO/LYSO under $\gamma$ -Rays

Consistent radiation hardness better than other crystals

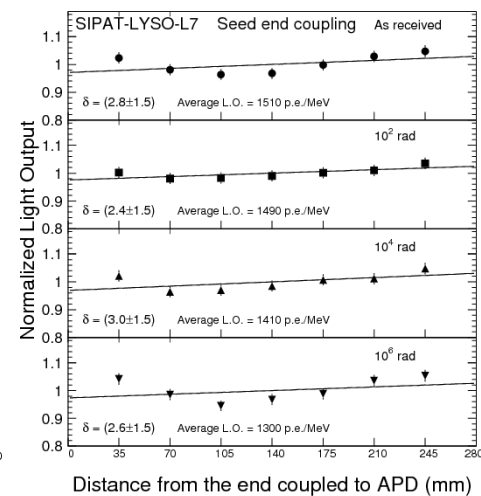

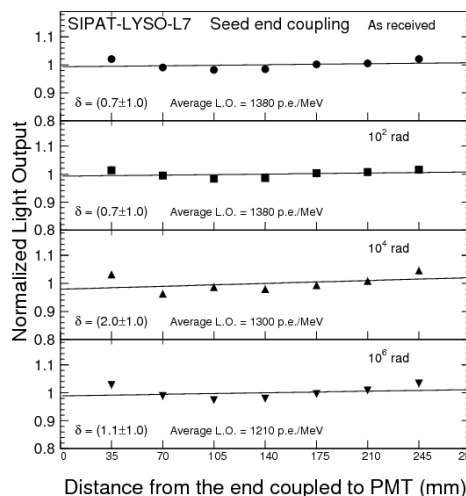

EWLT damage: 8% @ 1 Mrad

10% - 15% loss by PMT & APD

# Excellent Radiation Hardness

# LSO/LYSO ECAL for Mu2e

Four-vane calorimeter, comprised of 2,400 LSO/LYSO crystals of 30 x 30 x 130 mm

# LYSO Endcap for SuperB

SuperB Conceptual Design Report, INFN/AE-07/2, March (2007)

Aiming at  $10^{36}/\text{cm}^2/\text{s}$  luminosity for rare B decays

Need a fast detector with low noise at the endcap

LSO/LYSO

Need cost effective crystals

# LSO/LYSO Endcap for SuperB

The proposed SuperB ECAL endcap comprising 4,400 LYSO crystals in projective geometry

# Twenty Five Test Beam Crystals

All crystals are characterized in Caltech Crystal Laboratory  
Two beam tests were carried out at CERN and Frascati

# Dimensions and Surface Definition

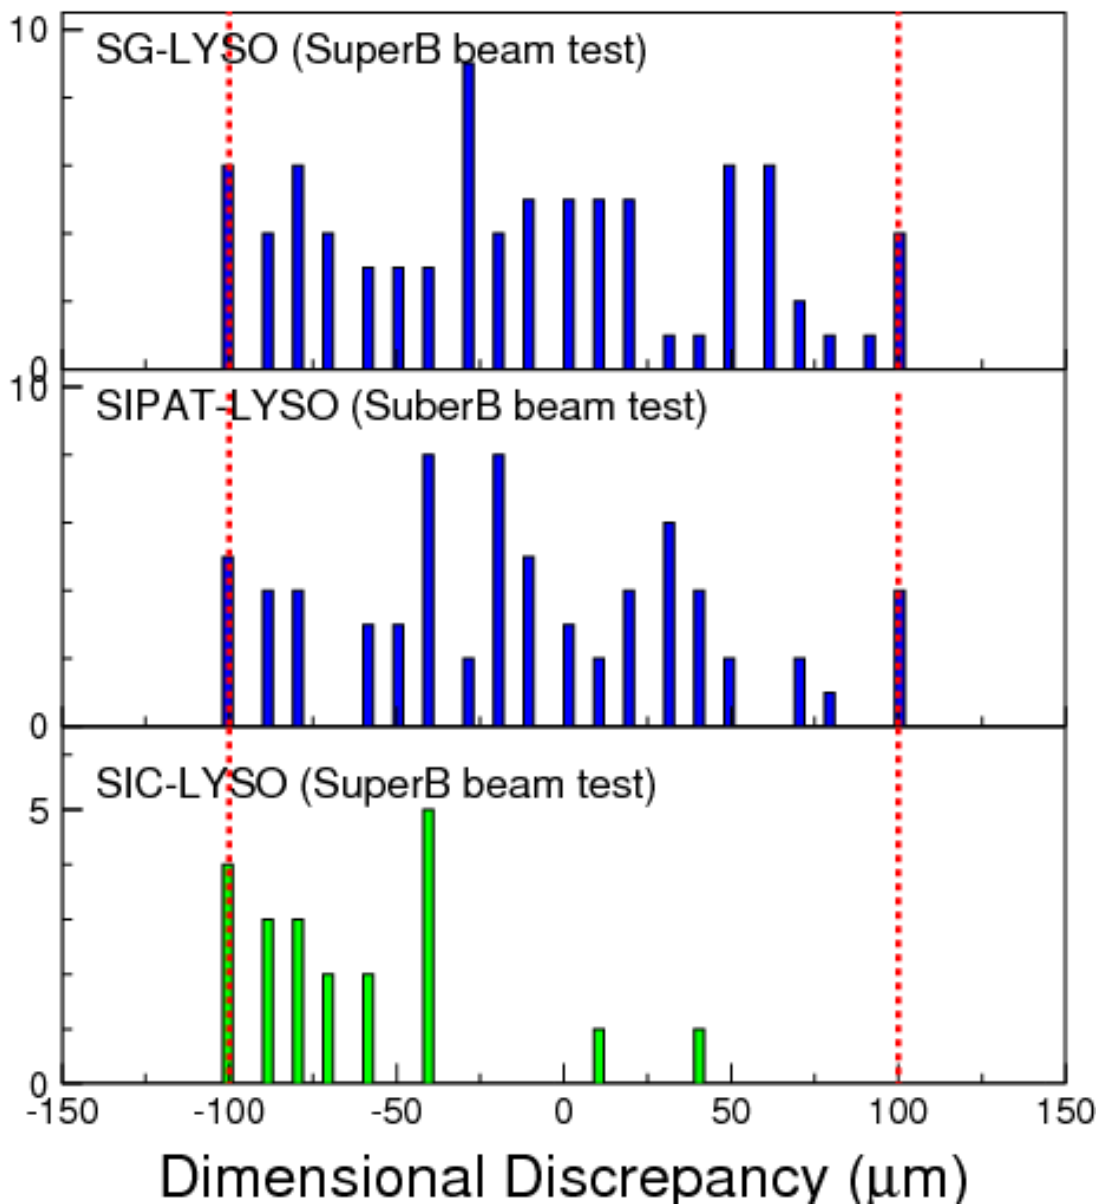

# Summary: Dimension

All dimensions satisfy the tolerance specification:  $\pm 100 \mu\text{m}$ . Will move to  $+0/-100 \mu\text{m}$  for mass production.

# Summary: LT% @ 420 nm

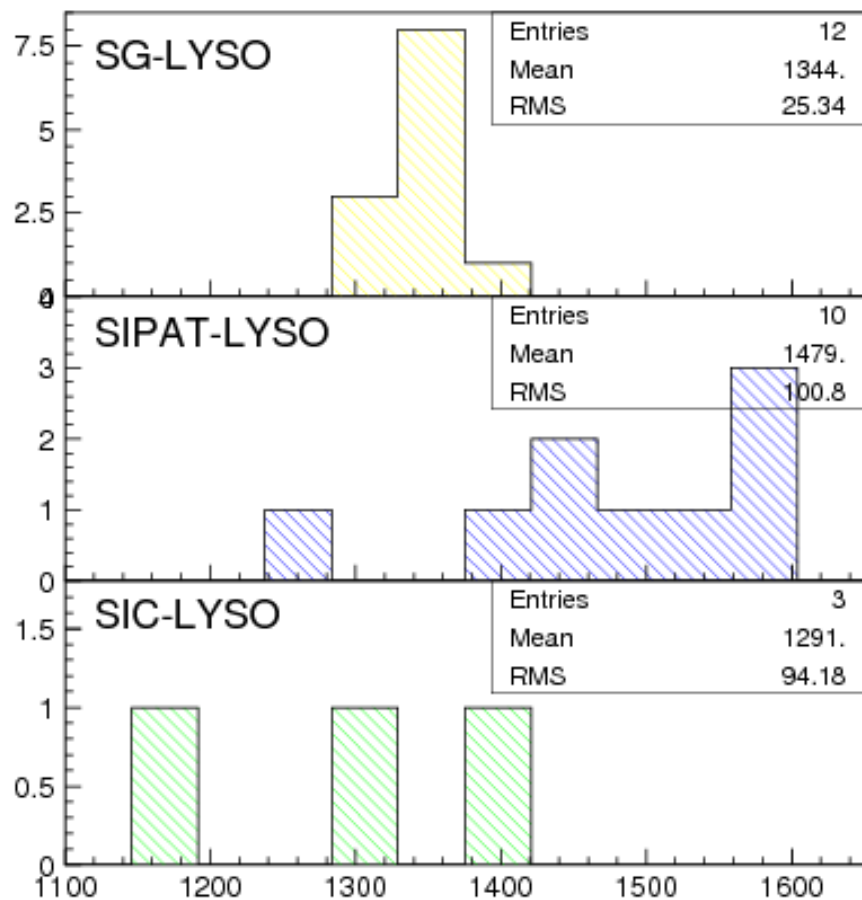

Orders: SIPAT, SG and SIC. All crystals satisfy the transmittance specification: 75%@420nm. Will keep this for mass production.

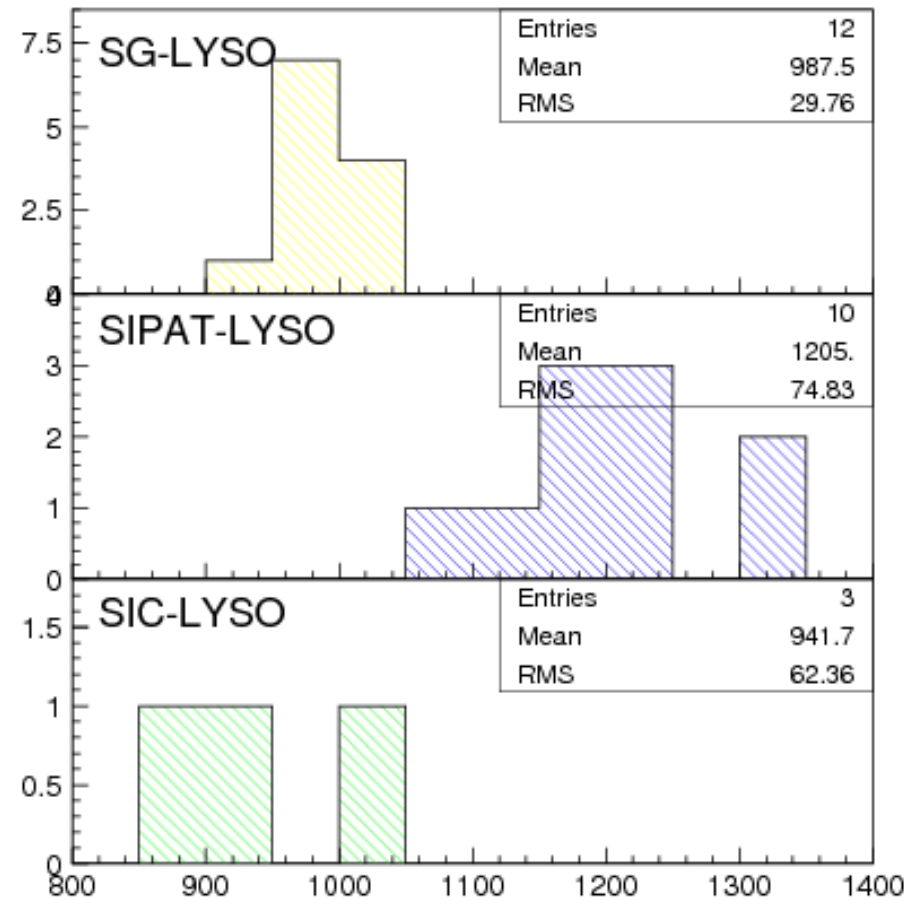

# Summary: L.O. by APD

Orders: SIPAT, SG and SIC, caused by emission?

L.O. by APD as Received(p.e./MeV)

L.O. by APD after Uniformization (p.e./MeV)

# Summary of SuperB Test Beam Crystals

Caltech-ID	Vendor-ID	Test-Beam-Position	Type	LT @ 420 nm (%)	LY, ER & Uniformity by PMT* (% of canal 1), (FWHM, %), (σ, %)	LY, ER & Uniformity by APD (As)* (p.e./MeV), (σ, %), (Δ, %) (rms, %)	LY, ER & Uniformity by APD (Uni)* (p.e./MeV), (σ, %), (Δ, %) (rms, %)	LO Loss %

\* Light Yield (LY) and Energy Resolution (ER) are the average of the seven points measured along the crystals.

Note 1 Light Yield (LY) for the APD readout is measured with a quartz plate between the crystal and the APDs.

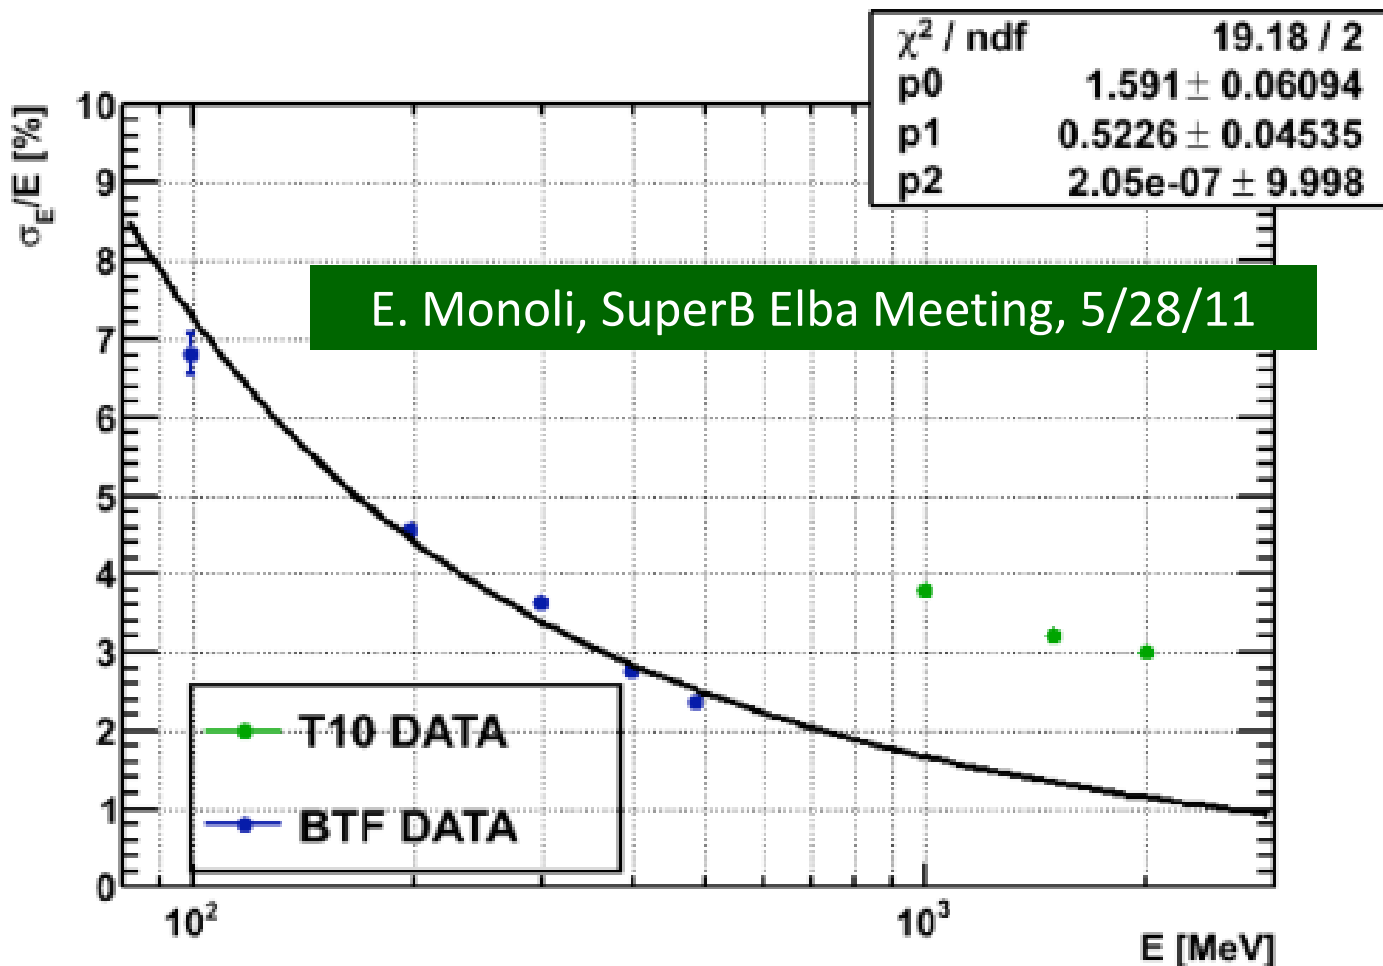

Note 2 Width of the black band at the small end on the smallest side surface: 15 mm

# SuperB LYSO Test Beam Result

Encouraging resolution measured at BTF, Frascati, with non uniformized crystals. Another test is planned in this Fall with uniformized crystals.

# Light Response Non-Uniformity: $\delta$

# CMS Specification for Uniformity

D. Graham & C. Seez, CMS Note 1996-002

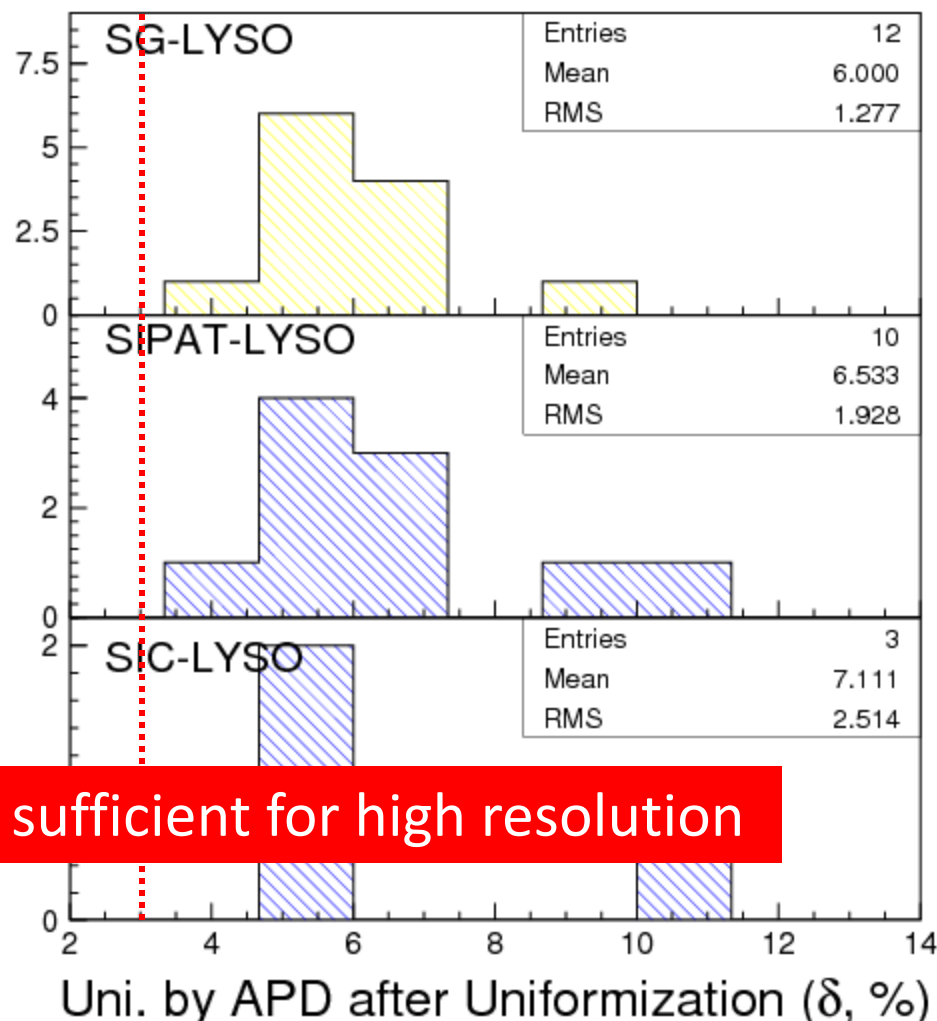

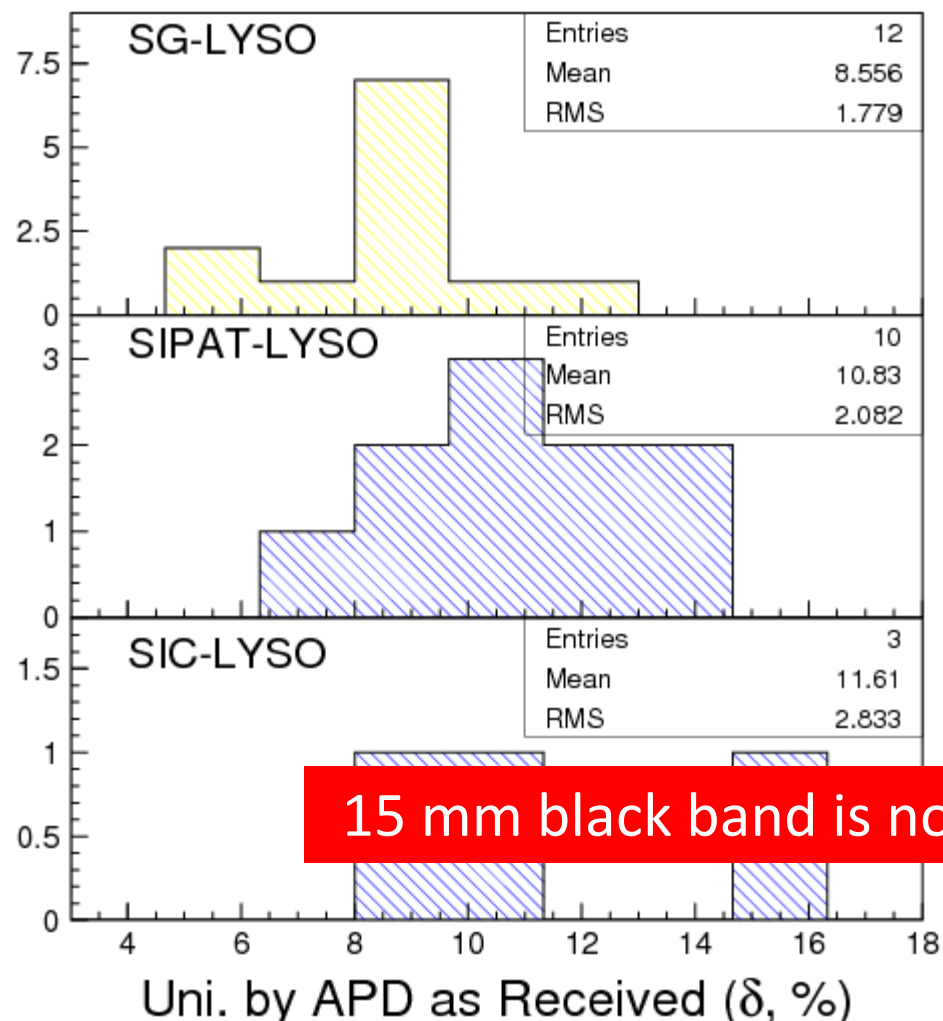

$|\delta| < 3\% \text{ \& \ } 4\% \text{ for } 18 X_0 \text{ (SuperB) \& \ } 25X_0 \text{ (CMS)}$

# Summary: Uniformity ( $\delta$ ) by APD

Diverse but consistent between vendors  
15 mm black paint is not sufficient for  $|\delta| < 3\%$

# Effect of Self-absorption

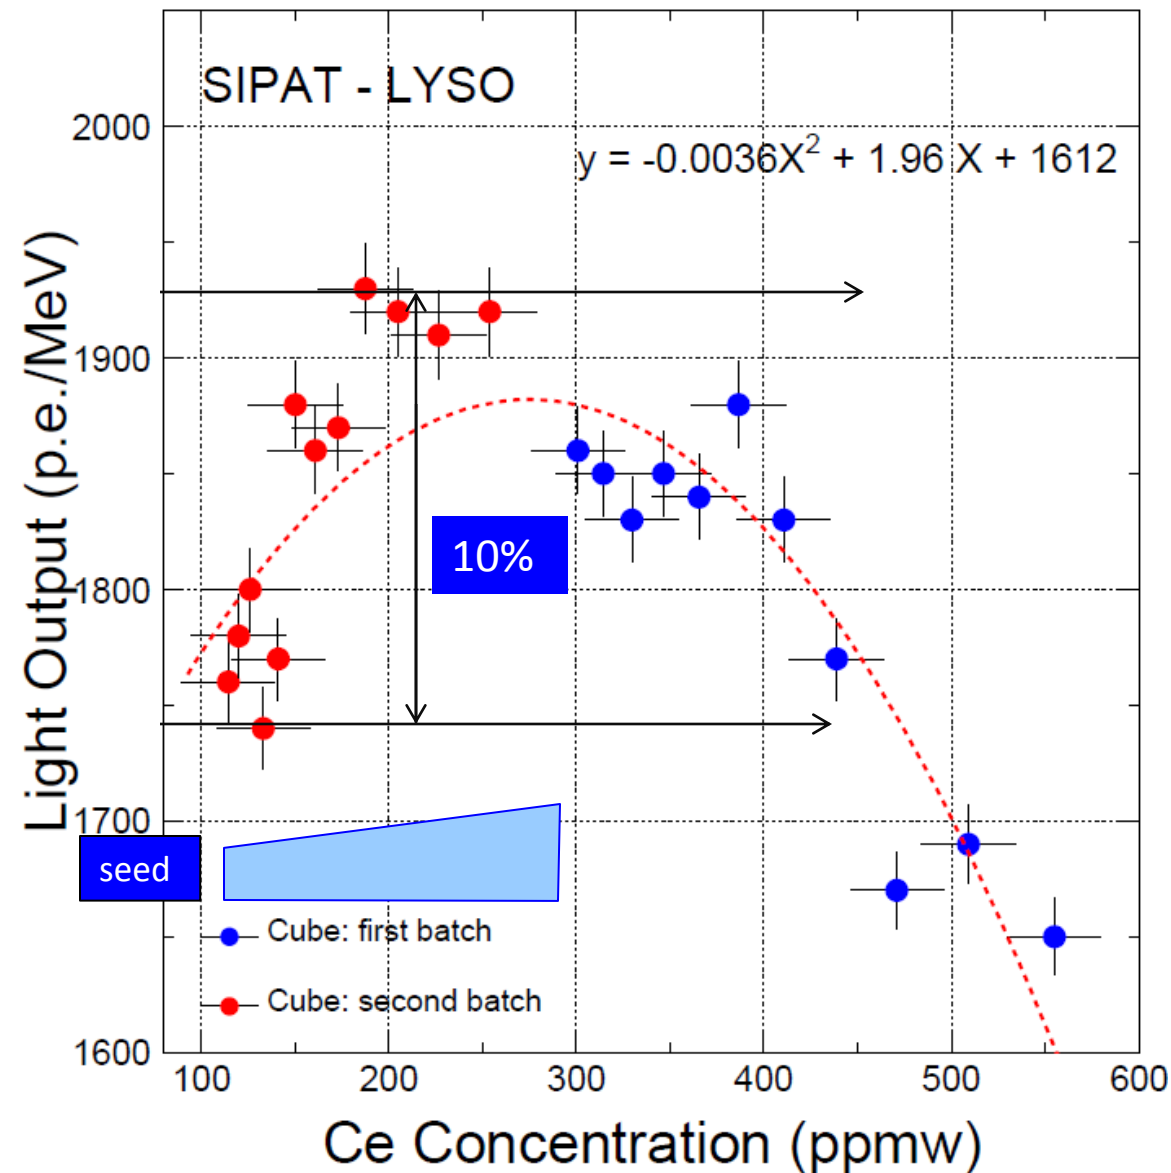

It is well known that part of the emission light is absorbed in the crystal: self-absorption.

# Effect of Cerium Segregation

It is also known that cerium concentration along long LYSO crystals is not uniform, causing non-uniformity up to 10% at two ends, indicating up to 5% variation in  $\delta$  is possible because of cerium segregation.

# Ray-Tracing Simulation “set-up”

The simulation package was developed in early eighties, and was used for the L3 BGO and CMS PWO crystals.

SuperB LYSO crystals

2 Hamamatsu  
S8664-55  
(2×5×5 mm<sup>2</sup>)

Silicon oil  
N=1.52

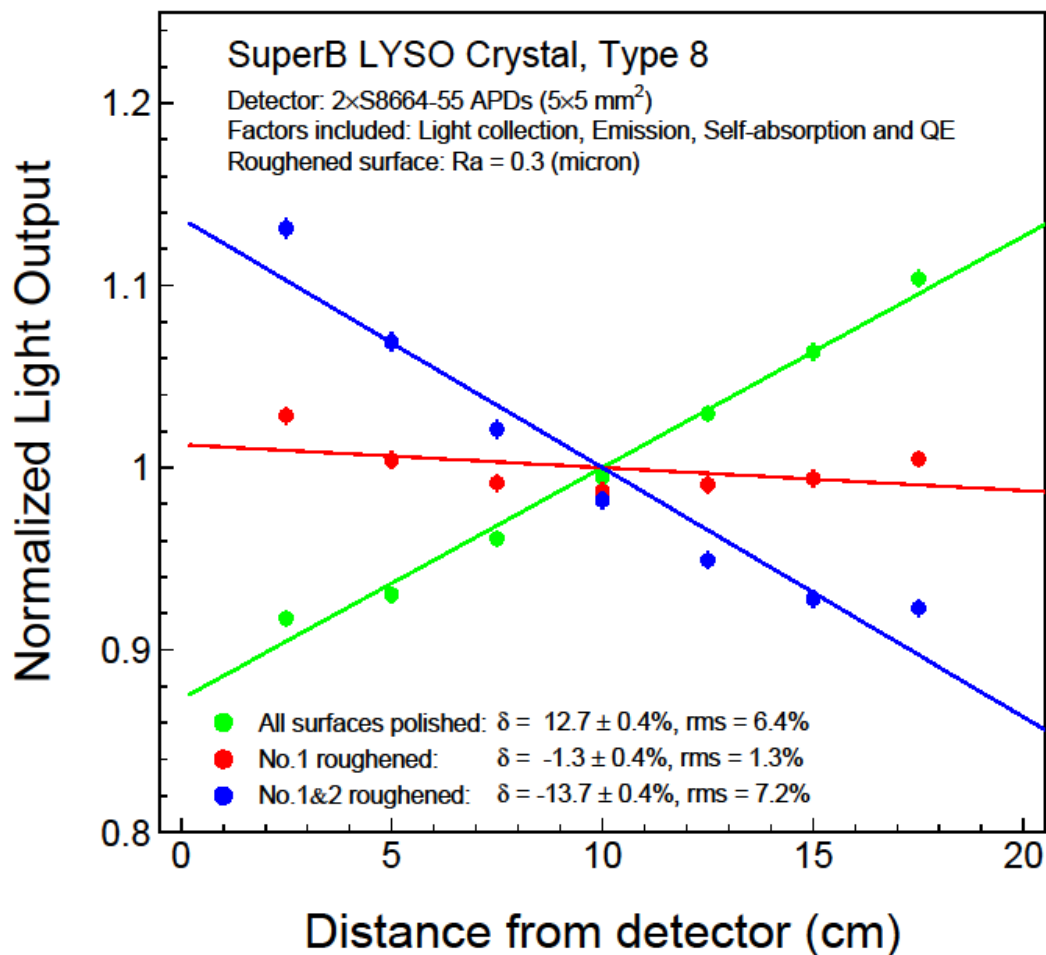

Tyvek paper

$$LO(z) = LY(z) \int Em(\lambda) LCE(\lambda, z) QE(\lambda) d\lambda$$

# Polished and Roughened Surfaces

- The optical focusing, effect dominates non-uniformity:  $\delta$  is about 13% for all polished surfaces.
- Roughened surface(s) can compensate the optical focusing effect.
- The best result is achieved by roughening only one side surface.

# How Rough it Should Be?

The  $R_a$  matters.

A variation of 0.1 in  $R_a$  causes a 3% variation in  $\delta$ .

# Real Exercise: Roughening SIC-LYSO-L3

The smallest side surface of SIC-LYSO-L3 was roughened to  $R_a = 0.3$  at SIC via a two step process

Thanks to SICCAS for roughening this crystal

Polished SIC-LYSO-L3

A photograph of a polished SIC-LYSO-L3 crystal, which is a long, thin, rectangular block with a smooth, reflective surface. It is placed on a blue background.

Roughened SIC-LYSO-L3

A photograph of a roughened SIC-LYSO-L3 crystal, which is a long, thin, rectangular block with a matte, textured surface. It is placed on a blue background.

1st: lapped to  $R_a = 0.5$  by using  $11 \mu\text{m Al}_2\text{O}_3$  powder for 10 min with 2.5 kg weight.  
2nd: lapped to  $R_a = 0.3$  by using  $6.5 \mu\text{m SiC}$  powder for 3 min with 1.5 kg weight.

# Relative Light Output & Uniformity

Ra = 0.3  
uniformize  
this crystal  
to < 2%.  
Ra = 0.25  
seems the  
best for  
this  
sample.

# CMS Forward Calorimeter Upgrade

Issues: Radiation hardness of photo-detector and WLS fiber

Issue: Radiation hardness of the photo-detector

Issues: Radiation hardness of the photo-detector and Cost

Crystal Cost: <\$10M

CMS ECAL endcap: Single Crystal: 160 cm<sup>3</sup>  
Total number: 16,000 Total Volume: 2.5 m<sup>3</sup>  
Expected Crystal Cost: ~\$60M@\$25/cc

# Performance of Scintillator Plates

## Crystals

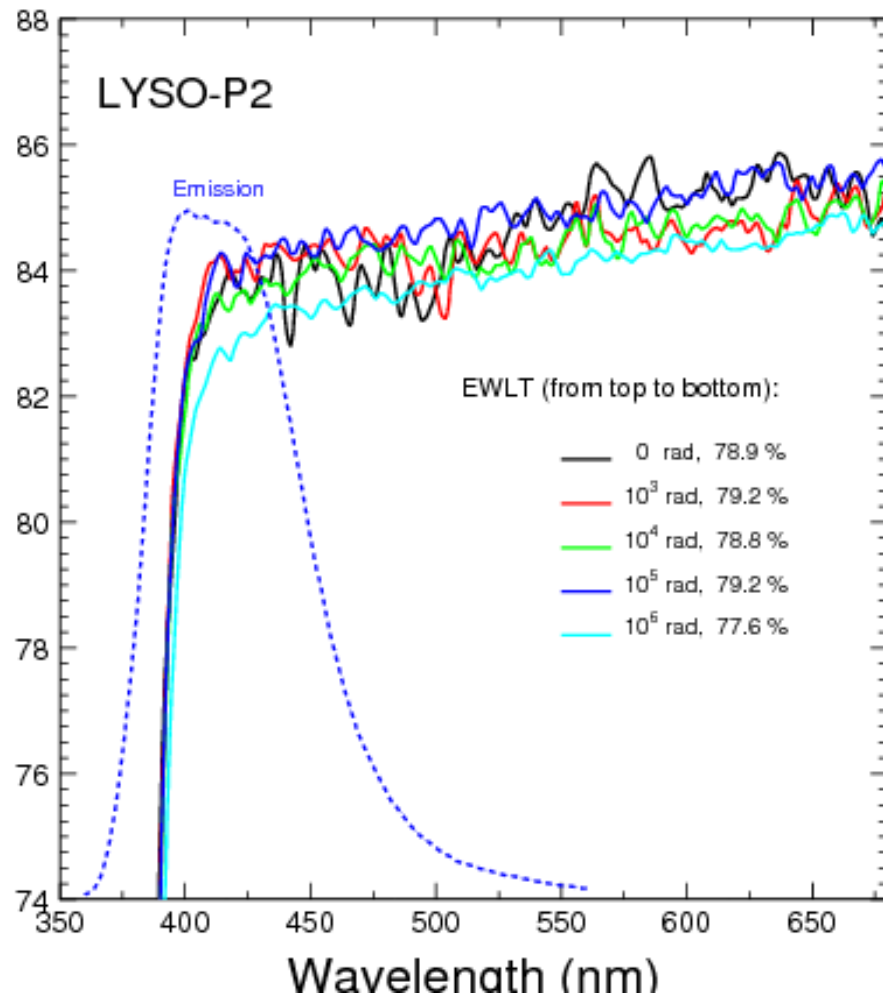

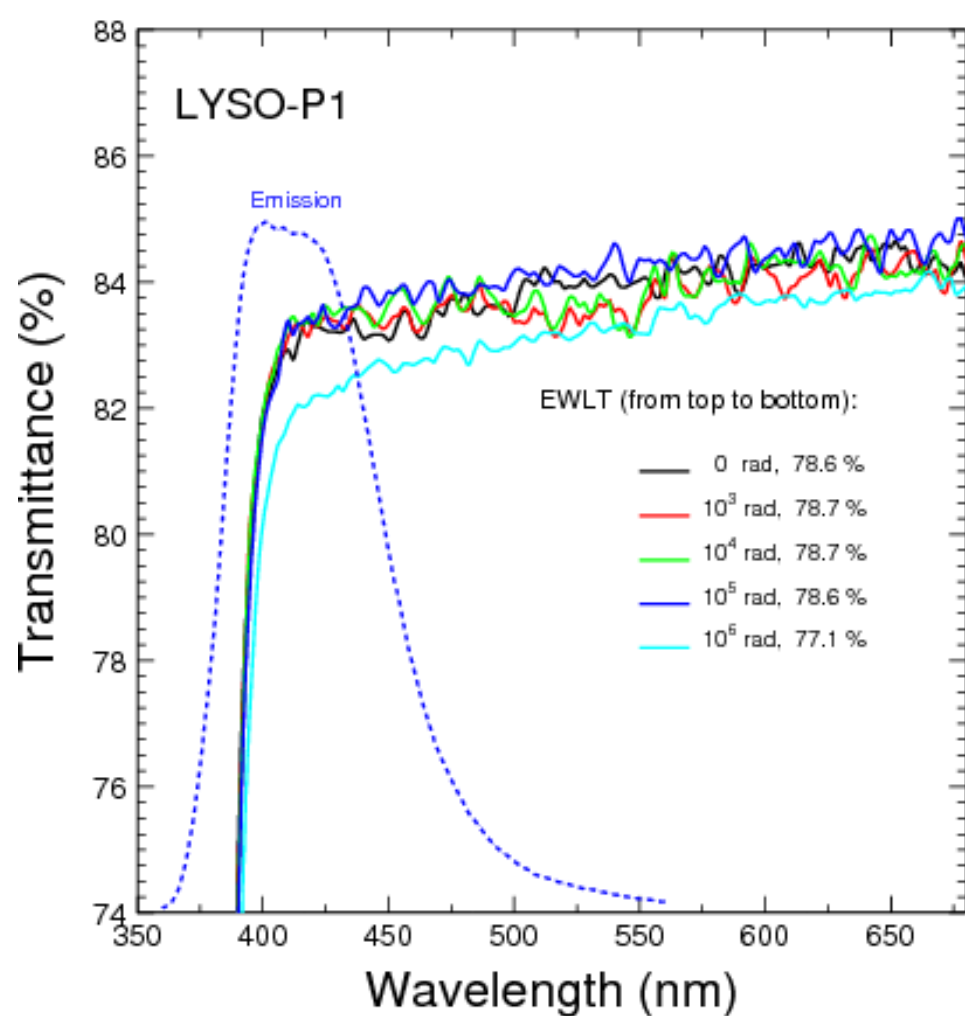

## Ceramics

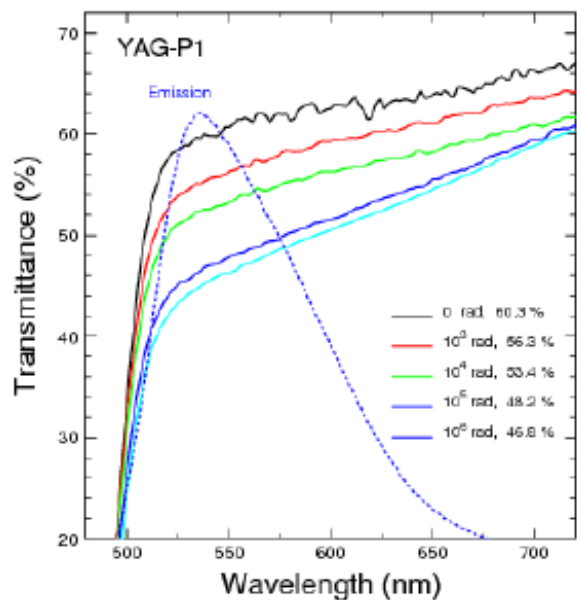

# Radiation Hard LYSO Plates

# Radiation Hardness of Ceramics

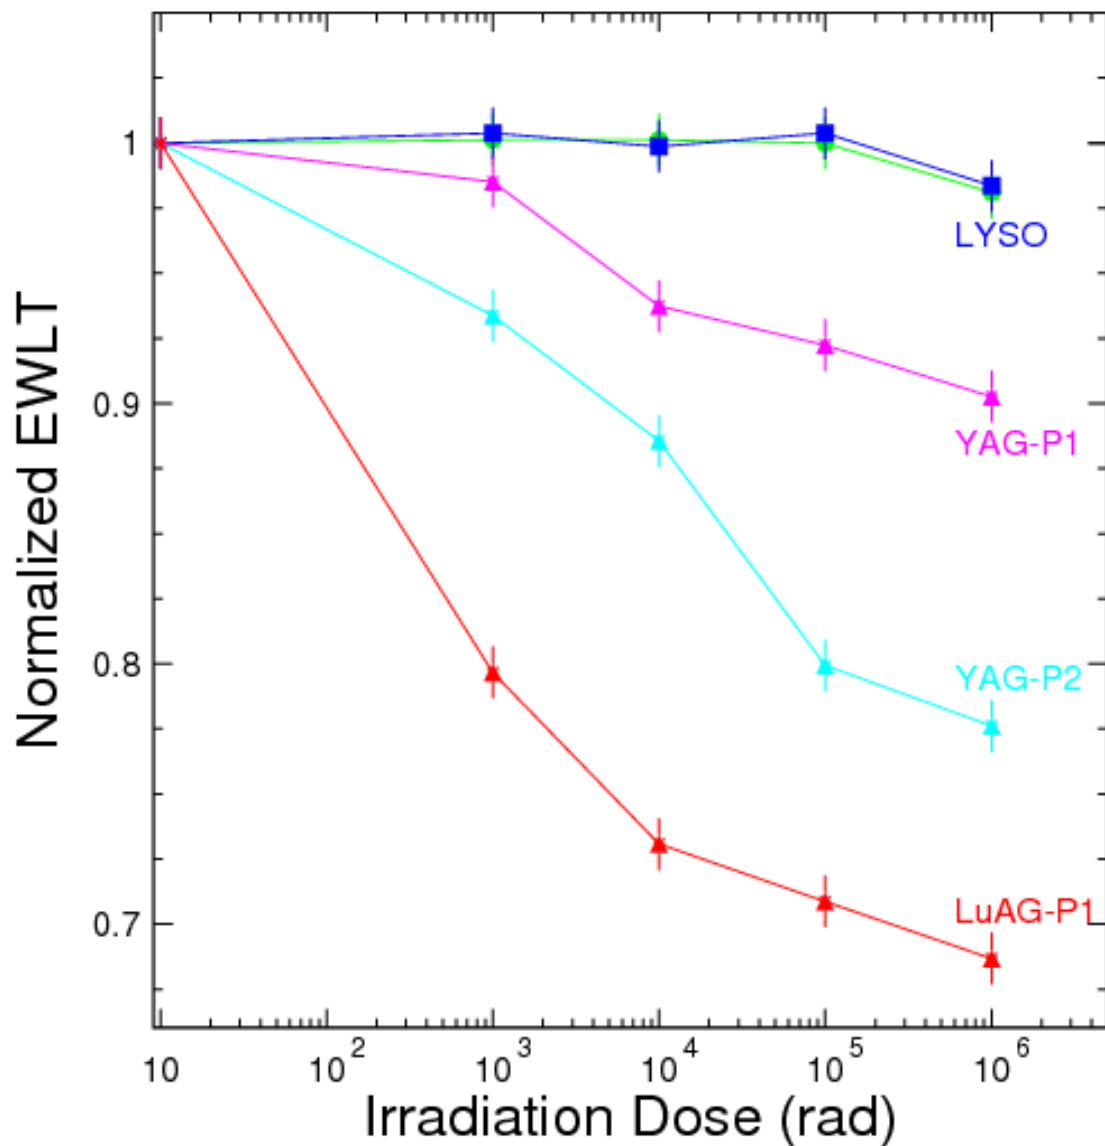

# Normalized EWLTL: LYSO & Ceramic

As expected that LYSO is radiation hard.

Ceramics, on the other hand, seem not.

Need to investigate further to see position dependence.

# Summary

- ❑ LSO/LYSO crystals with bright, fast scintillation and excellent radiation hardness is a good candidate material for CMS forward calorimeter upgrade.
  
- ❑ The light response uniformity of tapered LYSO long crystals is affected by (1) optical focusing, (2) self-absorption and (3) non-uniformity of the cerium concentration, and may be optimized by appropriate roughening to a side surface.
  
- ❑ For CMS forward calorimeter upgrade R&D works are concentrated on two directions:
  - Growth of crystals of adequate length/size cost-effectively; and
  - LSO/LYSO plates for sampling options. Initial test with YAG and LuAG ceramics indicates that they are not radiation hard.
